**SUSPENSION IDENTIFICATION**

**Introduction**
The Ridewell Self-Steering (RSS) 233 Suspension series is a fully integrated, auxiliary axle suspension system available for truck and trailer applications.

The RSS-233 20K Truck Suspension System can be configured with drum or disc brake axle assemblies and with an optional steering lock. The suspension system should be configured with a drum brake axle assembly for Roll-Off Applications.

Refer to the engineering drawing for detailed information on the suspension system components and operating parameters.

Additional information on available kingpin configurations and pivot bushing replacement is found in “233_232-Kingpin/Bushing-Parts Guide” (9710033).

**Suspension Identification Tag**
A (606-) Installation/Assembly Number will be listed as the Part Number when other system components are factory installed with the suspension (Figure 1).

The Suspension Number and Serial Number on the Suspension ID Tag refer to the model and the date of manufacture of an individual suspension system.

Please refer to the suspension number/part number and serial number on the Suspension Identification Tag when contacting Ridewell for customer service, replacement parts and warranty information.

**Notes and Cautions**
All work should be completed by a properly trained technician using the proper/special tools and safe work procedures.

Read through the entire Installation and Service Manual (ISM) before performing any installation or maintenance procedures.

The ISM uses two service notes to provide important safety guidelines for the suspension operation.

The service notes are defined as:

- “NOTE”: Provides additional instructions or procedures to complete tasks and make sure that the suspension functions properly.

- **CAUTION**: Indicates a hazardous situation or unsafe practice that, if not avoided, could result in equipment damage and serious injury.
Prior to Installation
Refer to the engineering drawing to confirm dimensional requirements and the range of ride heights available.

Installations can vary and procedures should be adapted for different vehicles, as needed.
• The Gross Axle Weight Rating (GAWR) is determined by the system component with the lowest load rating. Please consult with tire, wheel, axle and brake manufacturers before installation to determine the GAWR.
• If vehicle chassis modifications are required, consult with the vehicle manufacturer to ensure that such changes are permitted.
• Welding or altering suspension components is not permitted without the express written permission of Ridewell Suspensions.

Self-Steering Option
Self-steering suspensions are designed to steer only in the forward direction. The suspension must be raised off the ground or locked into a non-steering configuration during reverse travel to avoid damaging the suspension.
Use caution when maneuvering in reverse with the steering lock engaged. The driver should maintain slow maneuvering speeds and avoid extreme turns.
1. Ridewell Suspensions strongly recommends the use of automated systems that raise/lock the lift-axle during reverse travel.
2. For manual operations, Ridewell recommends the installation of a visual/audible indicator to assist the driver.

CAUTION Failure to lift the suspension and-or engage the steering-lock during reverse travel can cause component damage and void the warranty.

Installer Responsibilities
The installer of the suspension has the sole responsibility for proper attachment of the suspension system to the vehicle chassis.
• The installer is responsible for locating the suspension system on the vehicle to provide the proper load distribution.
• The installer must verify that vehicle crossmembers are positioned to support the suspension at the installing location.
• The installer must verify there is sufficient clearance for proper functioning of the installed auxiliary suspension – air springs; brake chambers; steering components; axle (including axle to driveline clearance); and, tires and wheels.
• It is the installer’s responsibility to determine that axle spacing conforms to any applicable federal and local bridge laws.
• The installer must verify that air reservoir volume requirements are met after suspension installation. Consult the vehicle manufacturer or Federal Motor Vehicle Safety Standards (FMVSS) 121 for more information.
Suspension Mounting

Refer to the suspension model engineering drawing for the suspension travel table; torque specifications; and, the spacing and clearance requirements for mounting the suspension.

The hanger locator flanges for 233 20K Truck Suspensions are factory installed to pre-set ride height. Ride height determined by the air spring mounting plate installed without a spacer (Figure 2).

A 2” spacer kit for the hangers and air spring mounting plates is available for the 233-20K disc brake and roll-off configurations.

Bolt-On Installation Procedure

Grade-8 bolts, flanged locknuts or locknuts with hardened washers are supplied by the installer.

Loosen crosschannel and pivot nuts on the hanger end of the 233 20K Roll-Off Suspension before installation. Torque to specifications during final assembly.

1. Measure vehicle frame width and the hanger-to-hanger inside dimensions of the suspension. Customer-supplied filler plates are required for the hangers and air spring mounting plates if the vehicle frame width is narrower than the suspension pre-set frame width.

2. Place the suspension, with any hanger/air spring filler plates or hanger/air spring spacer, in the desired installation location.

NOTE: A crossmember must be located on the frame within six inches of the leading or trailing edge of the hanger.

3. Check the installation location for adequate clearance of suspension components. The top of the hangers and air spring mounting plates must be parallel to the chassis frame to maintain the proper caster angle.

4. The frame hangers and air spring mounting plates should be perpendicular to the chassis frame and in alignment with each other. Clamp the hangers, the mounting plates, and any required spacer and filler plates firmly in place.

5. Refer to engineering drawing for the hanger/air spring mounting plate bolt-hole locations.

If the recommended bolt-hole locations are not available, locate and drill the bolt-holes as far apart as possible to provide the most support for the assembled suspension.

CAUTION: Check to make sure that wires, hoses or other components located within the frame rail are not affected by drilling.

6. Center-punch and drill six bolt-holes in each hanger. Bolt each hanger to the frame with 5/8-inch Grade 8 bolts and locknuts.

7. Center-punch and drill two bolt-holes in each air spring mounting bracket. Bolt each air spring bracket to the frame with two 5/8-inch Grade 8 bolts and locknuts.

8. Install/connect the air control kit (ACK) to the suspension (Page 6). Check the entire air system after installation for leaks and proper operation of air controls.

Final Assembly and Inspection

1. Verify that all suspension component bolts/nuts are torqued to specifications (Page 14).

2. Install wheels and tires.

CAUTION: When lowering an auxiliary axle on an unloaded vehicle, pressure to the load air springs must be reduced to below 10 psi. Failure to reduce the air pressure could cause the vehicle’s drive axles to rise from the ground and the vehicle could roll in an unsafe manner.

continued on next page
Final Assembly (continued from previous page)

3. Check that tires are inflated to recommended pressure. Check wheel hubs for proper level of lubricant recommended by the manufacturer.

4. Lift the axle to the raised position. Check the air system tubing and connections for leaks.

5. Check that wheels can rotate freely and that brakes and slack adjusters are properly adjusted.

6. Raise and lower the suspension assembly (wheels and tires installed) through the entire range of travel. Make sure that sufficient clearances for air springs, brake chambers and other components has been provided.

7. Check the vehicle’s reverse travel options:
   7.1 Check steer lock operation.
   7.2 Check automated system (if installed) to make sure that suspension raises/locks wheels during reverse travel.

Caution Failure to check reverse travel operations can result in component damage and void the suspension warranty.

Caution Do not lower the auxiliary axle while the vehicle is moving in forward or reverse travel above 10 mph.

Check wheel toe-in setting and adjust, if necessary (between 1/32” and 3/32”).

Caution Failure to torque bolts/nuts of suspension components to specifications can result in failure of the suspension and void the warranty.

Regulate load with air spring pressure

The load capacity of the auxiliary axle is adjusted by increasing or decreasing the pressure to the air springs. By applying more air, the lift axle takes on a greater percentage of the load’s weight. The load capacity is decreased as the air pressure decreases. Accurate readings of the load capacity can be obtained by parking a loaded vehicle over a calibrated scale and lowering the axle onto the scale. The air pressure to the air springs is manually adjusted up or down to obtain the axle load weight at various air pressures.

Caution Do not exceed the rated load capacity of the suspension system or other components. Exceeding the capacity can cause component failure and void the warranty.

Wheel Toe Setting

Wheel toe is the relationship of the distance between the front of the tires and the distance between the rear of the tires on the same axle. When the front distance is less than the rear distance, the wheels are in a “toe-in” (positive toe) condition.

The correct setting for the RSS-233 suspension should be toe-in between 1/32” and 3/32”.

Check Wheel Toe Setting

1. Deflate the air springs.

2. Lift the axle enough for tires to rotate freely. Support with jack stands to ensure axle is level.

3. Position tires to point straight ahead. Spin each tire. Use a piece of chalk to mark a line on the center tread all the way around the tire.

4. Use the centerline mark to measure the distance from the front of the tire to the frame. Measure the distance from the back of the tire to the frame.

5. Subtract the front of the tire distance from the rear distance to obtain the wheel toe setting.

Adjust Wheel Toe

1. Loosen clamps on both ends of the tie rod. Twist the tie rod forward/backward to move the front of the tire towards or away from the frame.

2. Continue rotating the tie rod until the proper toe-in setting is achieved.

3. Torque tie-rod clamps to 60-80 ft-lb (81-108 N-m).
Install air system components

Connect the load and lift air springs and an air control kit to the air system (Figure 3).

The air control kit (ACK) consists of a pressure regulator with a gauge connected to an air valve controlled by an electric switch or manual knob. The ACK allows the operator to control the air spring pressure so that the auxiliary axle can support different loads.

Ridewell has a number of manual/electric ACK configurations available. Installation will vary by the type of configuration.

CAUTION: The installer is responsible for making sure that air system requirements comply with the appropriate Federal Motor Vehicle Safety Standards.

### Air Control Kit – Troubleshooting

<table>

Recommended Service Intervals

Ridwell Suspensions recommends these minimum service intervals for standard duty, on-highway usage applications. More frequent intervals are recommended for heavier duty applications.

**Daily/Pre-Trip Inspections**

___ Visually inspect suspension structure for signs of damage or excessive wear.
___ Check for loose or missing bolts/nuts.
___ Check for irregular movement in suspension components.
___ Check tires for proper inflation, damage or excessive wear.
___ Check wheel-ends for obvious signs of lubricant leakage. Check for missing components.
___ Make sure air controls are operating properly. Drain all moisture from air reservoirs.

**First 6,000 miles of use**

___ Torque all suspension bolts/nuts to specifications (Page 11/Engineering Drawing).

**Every 12,000 miles of use**

___ Lubricate Brake Cam and Slack Adjuster.
___ Inspect kingpins and upper/lower kingpin bushings for wear. Grease thrust bearings.
___ Inspect steering damper for damage/wear.
___ Inspect air springs for any damage/excessive wear. Torque air spring bolts/nuts to specifications (Page 11/Engineering Drawing).
___ Check air system for leaks.

**First 50,000 miles of use**

___ Torque all suspension bolts/nuts to specifications (Page 11/Engineering Drawing).
___ Check wheel ends for excessive play.
___ Check pivot bushings for wear.
___ Check operation of (reverse) steering lock (if equipped).
___ Verify operation of manual/automatic lift-in-reverse control (if equipped).
___ Inspect tie-rod and the tie-rod ends for excessive damage/wear. Lubricate tie-rod ends. Check that tie-rod boot is in place and completely over the end of the tie-rod. Replace entire tie-rod end if boot is damaged.

**Annual/100,000 Miles Inspection**

___ Inspect pivot connections for worn bushings/wear washers. Replace if necessary. Torque all hardware to spec. (Pg 11/ENG Drawing).
___ Check hanger and air spring mounting plate connections to frame.

**Check lubrication level in wheel ends:**

___ Oil-Filled Wheel Ends:
   Refill/Replace lubricant as needed
   (See TMC RP 631—“100K/Annual Inspection”).
___ Check air system for leaks.
___ Test air tank pressure protection valve (PPV) if equipped.
___ Check brake chambers/brakes for damage and proper function.

⚠️ **CAUTION** Failure to exhaust all pressure from the air system before vehicle work can cause serious injury.

⚠️ **CAUTION** Failure to torque bolts/nuts of suspension components to specifications can result in suspension failure and void the warranty.

Figure 4.
Refer to the suspension model engineering drawing for the number of wear washers installed on the axle-end of the torque rod. The number of washers varies by the factory pre-set frame width.
5. Install new bushing into the eye of the torque rod. 
   NOTE: Mallet /press needed to install bushing.

6. **Hanger-End Torque Rod Bushing Installation**
   **Bushing Inner Sleeve - 4.1”**
   Press inner sleeve into the installed bushing. Center the sleeve so that both ends extend slightly past the sides of the bushing.
   Assemble the pivot connection with one wear washer on each side of the bushing (Figure 11). Inner sleeve must be flush with or extend slightly past the outside of wear washers on both ends.

7. **Axle-End Torque Rod Bushing Installation**
   **Bushing Inner Sleeve - 4.8”**
   Press inner sleeve into the installed bushing. Position inner sleeve so that one end extends further past the bushing than the other end.
   Assemble pivot connection with appropriate number of wear washers on either end of the inner sleeve (Figure 11). Inner sleeve must be flush with or slightly past the outside of the wear washers on both ends.

8. Torque pivot nut to specifications
   (500 ft-lb - 678 N-m).

9. Reassemble suspension, if necessary. Torque components to specifications.

10. Verify wheel toe-in setting between 1/32” and 3/32”. Adjust if necessary (Page 5).

Terms and coverage in this warranty apply only to the United States and Canada.

Ridewell Suspensions warrants the suspension systems manufactured by it to be free of defects in material and workmanship. Warranty coverage applies only to suspensions that have been properly installed, maintained and operated within the rated capacity and recommended application of the suspension. The responsibility for warranty coverage is limited to the repair/replacement of suspension parts. The liability for coverage of purchased components is limited to the original warranty coverage extended by the manufacturer of the purchased part.

All work under warranty must have prior written approval from the Ridewell warranty department. Ridewell has the sole discretion and authority to approve or deny a claim and authorize the repair or replacement of suspension parts. All parts must be held until the warranty claim is closed.

Parts that need to be returned for warranty evaluation will be issued a Returned Materials Authorization (RMA). Parts must be returned to Ridewell with the transportation charges prepaid. The transportation charges will be reimbursed if the warranty claim is approved.

This non-transferable warranty is in lieu of all other expressed or implied warranties or representations, including any implied warranties of merchantability or fitness or any obligations on the part of Ridewell. Ridewell will not be liable for any business interruptions, loss of profits, personal injury, any costs of travel delays or for any other special, indirect, incidental or consequential losses, costs or damages.

Contact the Ridewell Warranty Dept. at 417.833.4565 - Ext. 135, for complete warranty information.
