SUSPENSION IDENTIFICATION

Introduction
The Ridewell Universal Lift (RUL) 245 Truck Suspension is available for use in a range of applications. The suspension can be purchased with or without an integrated axle.

Refer to the engineering drawing for detailed information on the suspension system components and operating parameters.

Suspension Identification Tag
A (606-) Installation/Assembly Number will be listed as the Part Number when other system components are factory installed with the suspension (Figure 1).

The Suspension Number and Serial Number on the Suspension ID Tag refer to the model and the date of manufacture of an individual suspension system.

Please refer to the suspension number/part number and serial number on the Suspension Identification Tag when contacting Ridewell for customer service, replacement parts and warranty information.

Axle-Body Identification Tag
The Base-Axle Part Number (165-) and the Serial Number of the axle tube are listed on the Axle-Body ID Tag of Ridewell-branded round axles (Figure 2).

The Base-Axle Part Number refers to Ridewell-branded round axles manufactured in various axle wall thicknesses and widths.

More information on Ridewell-branded axles can be found in the “Trailer Axle Parts Guide” (9710029).

Notes and Cautions
All work should be completed by a properly trained technician using the proper/special tools and safe work procedures.

Read through the entire Installation and Service Manual (ISM) before performing any installation or maintenance procedures.

The ISM uses two types of service notes to provide important safety guidelines, prevent equipment damage and make sure that the suspension system operates correctly. The service notes are defined as:

“NOTE:” Provides additional instructions or procedures to complete tasks and make sure that the suspension functions properly.

⚠️ CAUTION Indicates a hazardous situation or unsafe practice that, if not avoided, could result in equipment damage and serious injury.
Prior to Installation

Refer to the engineering drawing to confirm dimensional requirements and the range of ride heights available.

Installations can vary and procedures should be adapted for different vehicles, as needed.

- The Gross Axle Weight Rating (GAWR) is determined by the system component with the lowest load rating. Please consult with tire, wheel, axle and brake manufacturers before installation to determine the GAWR.
- If vehicle chassis modifications are required, consult with the vehicle manufacturer to ensure that such changes are permitted.
- Welding or altering suspension components is not permitted without the express written permission of Ridewell Suspensions.

Installer Responsibilities

The installer of the suspension has the sole responsibility for proper attachment of the suspension system to the vehicle chassis.

- The installer is responsible for locating the suspension system on the vehicle to provide the proper load distribution.
- The installer must verify that vehicle crossmembers are positioned to support the suspension at the installing location.
- It is the installer’s responsibility to determine that axle spacing conforms to any applicable federal and local bridge laws.
- The installer must verify that air reservoir volume requirements are met after suspension installation. Consult the vehicle manufacturer or Federal Motor Vehicle Safety Standards (FMVSS) 121 for more information.
- The installer must verify there is sufficient clearance for proper functioning of the auxiliary suspension, air springs, brake chambers, steering components, axle (including axle to driveline clearance) and tires.
Axle Integration

Suspension systems are available with and without a factory integrated axle. Customer-supplied axle assemblies must be positioned and oriented (rotated) properly before welding the axle.

Use the top-center mark on the axle, if available, to identify the center of the axle and orient the axle assembly on the suspension. The axle assembly should be installed so that the camshafts, when activated, rotate in the same direction as the wheels.

**CAUTION** Failure to follow procedures and design specifications could result in injury, damage to the axle or suspension and void the warranty.

Weld Preparation

The joint to be welded should be positioned in the flat or horizontal position. All grease, dirt, paint, slag or other contaminants must be removed from the weld joint.

The axle and suspension components should be at a minimum temperature of 60°F (15.5°C). Pre-heat the weld zone to the axle manufacturer’s recommended pre-heat temperature, if required.

Weld Procedure

1. Center the axle assembly on the beams (Figure 3).
2. Check the engineering drawing for the brake component orientation (rotation) before clamping into place and making the final welds.
   
   2.1 Drum brake camshafts are spaced off the tail of the trailing arm beam. Make sure the brake chamber brackets are oriented properly and clamp the axle assembly into place.
   
   2.2 Disc brake assemblies have a right- and left-hand caliper assembly. Make sure the callipers are located on the correct side and rotated to the proper position before clamping the axle assembly into place.

3. Check the gap between the axle and the axle seats before welding (Figure 4). Side gaps should be no greater than 1/8”. The gap at the bottom of the axle seat should be no greater than 1/16”.

4. Weld the axle to the seat according to Ridewell Weld Process #1 (Page 5).

   NOTE: Mounted air springs should be covered to protect them from welding spatter.

I-Beam Axle Integration

1. Make sure that suspension beams are located at the proper frame width with the locator tabs on the bottom of the beams. Center the axle between the beams and clamp into place.

2. Drill four 25/32” holes in each beam. Drill two holes in front of the axle and two behind the axle.

3. Fasten each beam to the axle with four 3/4” Grade-8 fasteners. Check to make sure axle and beams are square before final tightening of nuts.

4. Adjust the wheel toe-in to the recommended 1/32” to 3/32”.

5. Lock the knuckles in place to prevent self-steering (Figure 5).

**Figure 3.** Axle should be centered between beams.

**Figure 4.** Correct axle seating for welding.

**Figure 5.** Use plate to lock the I-Beam Axle knuckle and make the axle non-steering.
1 - CAUTION: All welds must be kept away from the top and bottom of the axle where maximum stresses occur (see “NO WELDING ZONE” illustration above). Do not test-weld the arc on any part of the axle tube.

2 - All welders and welding operators should be certified as per the requirements of the American Welding Society (AWS) or equivalent. All electrodes used should meet the AWS specifications and classifications for welding carbon and low-alloy steels.

3 - Recommended Welding Methods: Shielded Metal Arc Welding (SMAW), Gas Metal Arc Welding (GMAW) or Flux Cored Arc Welding (FCAW). The welding method used and the electrode selected must develop a minimum weld tensile strength of 70,000 psi per AWS specifications. The best fusion and mechanical properties will be obtained by using the voltage, current, and shielding medium recommended by the electrode manufacturer. If the SMAW method is used, the stick electrodes must be new, dry, free of contaminants and stored per AWS specifications.

4 - Weld Joint Preparation: The joint to be welded should be positioned in the flat or horizontal position. All grease, dirt, paint, slag or other contaminants must be removed from the weld joint without gouging the axle tube. CAUTION: Never weld when the axle is cold. The axle and beam assemblies to be welded should be at a temperature of at least 60°F (15°C). Pre-heat the weld zone to the axle manufacturer’s recommended pre-heat temperature, if required. This will reduce the chance of an area of brittle material forming adjacent to the weld.

5 - The axle should fit into the beam assembly with a maximum root gap of 1/8-inch between the axle and the beam axle seat (see “WELD JOINT PREPARATION” illustration above).

6 - NOTE: Clamp the axle to the beam axle seat with a C-clamp prior to welding to make sure that proper contact occurs (see “CORRECT” illustration below).

7 - Ground the axle to one of the attached axle parts such as the brake chamber brackets, cam brackets or brake spider. Never ground the axle to a wheel or a hub as the spindle bearing may sustain damage.

8 - Multiple pass welding should be used on the beam/axle connection using the following guidelines: 8.1-Total fillet weld size should be 1/2-inch. 8.2-Weld pass starts and stops should be performed as illustrated above. 8.3-Never start or stop welds at the end of the weld joint. 8.4-Each pass must be accomplished in one or two segments. 8.5-Start welds at least 1-inch from the end and backweld over the start. Backstep fill all craters. 8.6-If process is not GMAW all slag must be removed between passes. 8.7-Welds must go to within 1/8-inch +/- 1/16-inch of the ends of the axle seat and must not go beyond or around the ends of the axle seat. 8.8-Post-weld peening is recommended, but not required: Needle peen the entire toe of the second pass, including around the ends of the axle seat. Hold the needles perpendicular to the axle. A uniform dimpled pattern will appear when properly peened.
Mounting the suspension to the frame

Refer to the engineering drawing for the range of ride heights available, torque values, spacing and clearance requirements of the suspension.

A 1” or 2” spacer kit is available for the hangers and air spring mounting plates.

Suspension hangers are attached to the vehicle frame with six 5/8” Grade 8 bolts in each hanger. Air spring mounting brackets require two 5/8” Grade 8 bolts. Flanged locknuts or locknuts with hardened washers are required.

Bolt-On Installation Procedure

Mandatory customer-supplied crossmember locations are shown on the engineering drawing. A cross brace between the hangers is not required if the frame crossmembers are located above the air spring mounting plates and the hangers.

1. Locate the hangers and air spring mounting plates (and spacers, if necessary) on the chassis and clamp firmly into place. The hangers, mounting plates and spacers (if installed) must have full contact to the bottom of the frame.

2. Make sure that hangers and mounting plates are evenly located and square to the frame for proper axle alignment. Check that location provides adequate clearance for suspension components.

3. Refer to the engineering drawing for the recommended bolt hole locations on the hangers and air spring mounting plates. Center punch and drill six bolt holes in each hanger. Center punch and drill two bolt holes in each air spring mounting plate.

   **CAUTION** Check to make sure that wires, hoses or other components located within the chassis are not affected by drilling.

4. Bolt hangers and mounting plates to the chassis with Grade 8 bolts and locknuts.

5. Assemble the load air springs to the air spring mounting plates.

6. Install/connect the air control kit (ACK) to the suspension (Page 7). Check the air system after installation for leaks and proper operation of controls.

7. Perform final assembly and inspection and align the suspension per TMC or SAE recommended standards (Appendix). Alignment should be performed with suspension at installed ride height.

   **CAUTION** Failure to torque bolts/nuts of suspension components to specifications can result in failure of the suspension and void the warranty.

Final Assembly and Inspection

1. Verify that all suspension component bolts/nuts are torqued to specifications (Appendix).

2. Install wheels and tires.

   **CAUTION** When lowering an auxiliary axle on an unloaded vehicle, pressure to the load air springs must be reduced to below 10 psi. Failure to reduce the air pressure could cause the vehicle’s drive axles to rise from the ground and the vehicle could roll in an unsafe manner.

3. Check that tires are inflated to recommended pressure. Check wheel hubs for proper level of lubricant recommended by the manufacturer.

4. Lift the axle to the raised position. Check the air system tubing and connections for leaks.

5. Check that wheels can rotate freely and that brakes and slack adjusters are properly adjusted.

6. Raise and lower the suspension assembly (wheels and tires installed) through the entire range of travel. Make sure that sufficient clearances for air springs, brake chambers and other components has been provided.

   **CAUTION** Do not lower the auxiliary axle while the vehicle is moving above 10 mph.

Regulate load with air spring pressure

The load capacity of the auxiliary axle is adjusted by increasing or decreasing the pressure to the air springs. By applying more air, the lift axle takes on a greater percentage of the load’s weight. The load capacity is decreased as the air pressure decreases.

Accurate readings of the load capacity can be obtained by parking a loaded vehicle over a calibrated scale and lowering the axle onto the scale. The air pressure to the air springs is manually adjusted up or down to obtain the axle load weight at various air pressures.

   **CAUTION** Do not exceed the rated load capacity of the suspension system or other components. Exceeding the capacity can cause component failure and void the warranty.
Install air system components

Connect the load and lift air springs and an air control kit to the air system (Figure 6).

The air control kit (ACK) consists of a pressure regulator with a gauge connected to an air valve controlled by an electric switch or manual knob. The ACK allows the operator to control the air spring pressure so that the auxiliary axle can support different loads.

Ridewell has a number of manual/electric ACK configurations available. Installation will vary by the type of configuration.

**CAUTION** The installer is responsible for making sure that air system requirements comply with the appropriate Federal Motor Vehicle Safety Standards.

### Troubleshooting – Air System Installation

</tbody>
</table>
A visual inspection of the suspension structure should be performed during each pre-trip/safety inspection. Ridewell Suspensions recommends the following minimum service intervals for standard duty, on-highway usage applications. More frequent intervals are recommended for heavier duty applications.

### Daily/Pre-Trip Inspections
- Check tires for proper inflation, damage or excessive wear.
- Check wheel-ends for obvious signs of lubricant leakage. Check for missing components.
- Check axle assemblies for damage/loose components.
- Visually inspect suspension structure for signs of damage or excessive wear.
- Check for loose or missing bolts/nuts. Check for irregular movement in suspension components.
- Make sure air controls are operating properly. Drain all moisture from air reservoirs.

### Every 12,000 miles of use
- Inspect air springs for any damage or excessive wear. Torque air spring bolts/nuts to specifications (see torque values chart in Appendix).
- Check air lines and connections for leaks.
- Lubricate Brake Cams and SlackAdjusters.

### First 50,000 miles of use
- Torque all suspension component bolts/nuts to specifications (see Appendix).
- Check wheel ends for excessive play.

### Annually/100,000 miles of use
- Inspect pivot connections for worn pivot bushings and replace, if necessary. Torque pivot hardware and component bolts/nuts to specifications (Appendix).
- Check suspension hanger and air spring mounting plate connections to frame.
- Check lubrication level in wheel ends:
  1) Oil-Filled Wheel Ends: Refill/Replace lubricant as needed (Refer to TMC RP 631 “100K/Annual Inspection”).
  2) Semi-Fluid Grease: Pull outer bearing and visually inspect lubrication level. Refill/Replace as needed (Refer to TMC RP 631 “Level 3 Lubrication Level Inspection” and TMC RP 618 “Wheel Bearing Adjustment Procedure”).
- Check air system for leaks.
- Test air system pressure protection valve (if equipped).
- Check brake chambers and brakes for damage and proper function.

### Pivot Bushing Inspection Procedure
Park the unloaded trailer on a level surface. Set the brakes and chock the tires so vehicle cannot move during inspection.

Insert the flat end of a pry-bar between one side of the hanger sidewall and the wear washers. Move the pry-bar back-and-forth and look for excessive movement of the beam (NOTE: A small amount of beam movement because of the rubber flexing is normal). Inspect the wear washers for excessive wear/damage. Repeat the pry-bar process and wear washer inspection on the other side of the hanger. If any large/easy movement or damaged wear washers is observed, drop the beams for further inspection. Replace components as necessary.

---

Refer to the following Technology & Maintenance Council (TMC) publications for additional maintenance information:

- TMC RP 609  Self-Adjusting and Manual Brake Adjuster Removal, Installation and Maintenance
- TMC RP 618  Wheel Bearing Adjustment Procedure
- TMC RP 619  Air System Inspection Procedure

**Torque values reflect a lubricated thread condition (Nuts are pre-lubed). Do not overtorque.**

⚠️ **CAUTION** Suspension is shipped with minimal torque applied to fasteners. It is the installer’s responsibility to apply the proper torque values. All fasteners, except shear-type pivot bolt, MUST be re-torqued after the first 6,000 miles of operation. Failure to install and maintain suspension component fasteners at torque specifications could result in suspension failure and void the warranty.

Bushing Replacement Procedure – Narrow Bushing Replacement Tool #6100044

Park the vehicle on a level surface. Chock wheels to keep vehicle from moving. Raise vehicle to height that removes load from suspension and support with jack stands. Disconnect the linkage from the height control valve(s), if equipped. Exhaust all air from the air system.

**CAUTION** Failure to properly chock wheels, exhaust the air system and safely support the vehicle could allow vehicle/suspension movement that could result in serious injury.

**Disassemble suspension**

Remove wheels and tires, if necessary. Disassemble the pivot connections. Remove and inspect adjuster plate and alignment washer(s). Replace, if necessary.

Discard pivot hardware (new pivot hardware and wear washers included in bushing replacement kit).

Rotate trailing arm beams down and out of the hang-ers. Inspect the pivot bolt holes and the hanger surfaces for unusual wear or damage. Repair or replace components, as needed.

**Bushing Replacement Tool Assembly**

Make sure that the thrust washer is firmly seated in the flat (outside) edge of end cap. Examine both the tool cone tapered insert and larger open end for any damage/out-of-round. Repair or replace if necessary.

**Bushing Removal**

1. Lubricate hex-head bolt threads and thrust bearing with Extreme Pressure Lube (#1980014).

   NOTE: Failure to apply lubricant could result in decreased performance and reduced tool life.

2. Place flat washer onto hex-head bolt, followed by the bearing collar, then the end cap. The bushing tool cone tapers to a smaller opening on one end. Place larger opening of the cone onto the end cap. NOTE: Always place the tapered end of the cone against the eye of the beam (Figure 9).

3. Insert the end of the hex bolt through the bushing sleeve into the center opening of the plunger. Make sure the cone is centered on the beam eye and tighten the hex bolt until the plunger is firmly against the bushing.

4. Use a 1 1/4” socket on a 3/4” drive impact wrench (1” recommended) to rotate hex bolt and press bushing out of the beam eye into the cone. NOTE: It may require a small amount of heat to break the bond between the bushing and the beam eye. Do not overheat. Allow beam to cool before installing the new bushing.

5. Disassemble the bushing replacement tool. Remove old bushing from cone and discard.

   **Continued on next page**

**Figure 9. Bushing Tool #6100044**

The tapered cone expands the rubber bushing during removal and compresses the bushing for installation. Always place the tapered end of the cone against the beam eye for bushing installation and removal.
Replacement w/ 6100044 tool (continued)

Bushing Tool Assembly – Installation
Place the flat washer, the bearing collar, and the end-cap assembly on the hex-head bolt.
1. Use a wire brush to clean debris and corrosion out of the beam eye.
2. Liberally apply P80® lubricant or soap solution to the inside of the beam eye, the outside of the bushing and inside the tool cone.
3. Insert the new bushing into the large end of the tool cone.
4. Place the plunger/cone/bushing assembly on the beam eye (Figure 9).
5. Insert the hex-head bolt assembly through the beam eye. Thread the hex bolt into the plunger until the end-cap rests against the beam.
6. Center the bushing tool cone on the beam eye. Use a 1 1/4” socket on a 3/4” drive impact wrench (a 1” impact wrench is recommended) to rotate the hex bolt and press the bushing into the beam eye.
7. Disassemble and remove the bushing replacement tool. Check placement to make sure the bushing is centered in beam.

Reassemble suspension
Rotate trailing arm beams into hangers. Install pivot connection hardware – alignment washers, adjuster plates, wear washers, shear-type pivot bolt, flat washer and flanged locknut.
NOTE: Do not lubricate pivot bolt/nut.
Tighten flanged locknut until adjuster plate pin is engaged and pivot hardware is snug against hanger. Do not apply final torque until axle alignment has been checked.

Connect air system (if disconnected). Install wheels and tires (if removed). Inflate air springs. Raise vehicle and remove support stands. Lower vehicle to ground.

Check axle alignment and realign (Appendix). Tighten pivot bolt with a 1” drive impact wrench and E-20 Torx® socket (Ridewell tool 6100054) until the Torx® head is sheared off.

Failure to properly torque pivot hardware can result in suspension failure and void warranty.

Wide Bushing Replacement Procedure:
RUL-245 Suspensions Manufactured Before 2009 – Factory Bonded Wide Bushing (6 3/4”)
Park the vehicle on a level surface. Chock wheels to keep vehicle from moving. Exhaust all air from the air system. Disassemble suspension, if necessary, to reach pivot connections.

Bushing Replacement
Refer to the engineering drawing for additional component part numbers and torque values.

Service Parts Needed:
1987625B000 - Epoxy - Fusor320 50ML (tube)
1117625C060 - Bushing - Monopivot 62Duro
1. Remove the old bushing from load beam or sleeve. NOTE: Apply heat to the outside of the sleeve with an oxyacetylene torch to destroy any remaining bonding element and make bushing removal easier.
2. Use a wire brush to remove any remaining bonding residue, rubber, dirt, rust, etc, from the sleeve bore.
3. Wash the bore of the bushing sleeve with paint thinner. Wash the surface of the replacement bushing with paint thinner.

Epoxy adhesive and paint thinner are flammable materials that are irritating to the eyes, respiratory system and skin. Thoroughly read all label instructions before use.
4. Remove cap from Epoxy Adhesive 50ml tube kit. Squeeze out entire contents of adhesive. Thoroughly mix the two-parts of the adhesive NOTE: Adhesive must be used within 20 minutes after mixing.
5. Spread mixed adhesive on the entire surface of the replacement bushing. Apply adhesive to the inside of the sleeve bore.
6. Press replacement bushing into the bore of the sleeve until bushing is centered.
7. Wipe the excess adhesive from the ends of installed bushing with paint thinner.
8. Adhesive can be handled after four hours and will totally cure after 24 hours.

Adhesive must be totally cured before returning vehicle to service.

Reassemble the suspension, if necessary. Torque all fasteners to specifications.
Axle Alignment

Alignment should be performed on a level surface with the suspension at the desired ride height. Refer to the engineering drawing for the designed ride heights of the suspension model.

Align the suspension per TMC or SAE recommended standards. On a multiple-axle vehicle, the forward axle is moved into the proper alignment, then the remaining axles are positioned so that they are parallel to the forward axle. A maximum tolerance of 1/8-inch difference from side-to-side of the forward axle and 1/16-inch difference from side-to-side for the aft axles is acceptable (Figure 10).

![Axle Alignment](image)

**Speed Set™ Alignment**

The RUL-245 Auxiliary Axle Suspension is equipped with the Ridewell Speed Set® alignment feature for simple, manual alignment of the axles.

**Axle alignment procedure**

1. Loosen the pivot nut enough for beam to move.
2. Locate the adjuster plate at the pivot connection. Insert a 1/2”-shank breaker bar into the square hole of the adjuster plate. Move the arm beam forward or backward until the axle reaches alignment (Figure 11).
   
   NOTE: Check to make sure that the pivot bushing is not wedged sideways during beam movement. The adjuster plate and alignment washer on the two sides of the hanger should move in unison with the beam.

3. Tighten the pivot nut so that beam can no longer move. Re-check alignment measurements and adjust, if necessary.
   
   NOTE: Check to make sure that both the adjuster plate and alignment washer are flat against the hanger before final torque is applied.

4. Use a 1” drive impact wrench with an E-20 Torx® socket to tighten the pivot bolt until the Torx head is sheared off.

**Figure 10.**

Kingpin measurement for axle alignment.

Check the forward axle alignment by measuring from the kingpin to both ends of the axle centers.

If the difference between the “A” measurement and the “B” measurement is greater than 1/8-inch, the forward axle needs to be aligned.

If the difference between the “C” measurement and the “D” measurement is greater than 1/16-inch, the aft axle needs adjustment.

**Figure 11.**

Move axle back and forth with adjuster plate and breaker bar until axle reaches aligned position.
Terms and coverage in this warranty apply only to the United States and Canada.

Ridewell Suspensions warrants the suspension systems manufactured by it to be free of defects in material and workmanship. Warranty coverage applies only to suspensions that have been properly installed, maintained and operated within the rated capacity and recommended application of the suspension. The responsibility for warranty coverage is limited to the repair/replacement of suspension parts. The liability for coverage of purchased components is limited to the original warranty coverage extended by the manufacturer of the purchased part.

All work under warranty must have prior written approval from the Ridewell warranty department. Ridewell has the sole discretion and authority to approve or deny a claim and authorize the repair or replacement of suspension parts. All parts must be held until the warranty claim is closed.

Parts that need to be returned for warranty evaluation will be issued a Returned Materials Authorization (RMA). Parts must be returned to Ridewell with the transportation charges prepaid. The transportation charges will be reimbursed if the warranty claim is approved.

This non-transferable warranty is in lieu of all other expressed or implied warranties or representations, including any implied warranties of merchantability or fitness or any obligations on the part of Ridewell. Ridewell will not be liable for any business interruptions, loss of profits, personal injury, any costs of travel delays or for any other special, indirect, incidental or consequential losses, costs or damages.

Contact the Ridewell Warranty Dept. at 417.833.4565 - Ext. 135, for complete warranty information.
