Bendix® ADB22X™, ADB22X-V™ & ADB22X™-LT Air Disc Brakes

SECTION ONE: AIR DISC BRAKE OVERVIEW

1.1 DESCRIPTION
Bendix® ADB22X™, ADB22X-V™ and ADB22X™-LT Air Disc Brakes (ADB) use a floating caliper design to provide foundation braking on all axles of heavy commercial vehicles, buses and trailers. Bendix air disc brakes provide safety and performance as well as ease of service.

The ADB22X disc brakes mount to the axle's anchor plate (torque plate) using fasteners that are installed parallel to the axle, while the anchor-plate fasteners used for the Bendix ADB22X-V air disc brakes install at right angles to the axle. The ADB22X-LT air disc brake is designed for trailer applications.

Available with or without a combination spring brake unit, these brakes may also include optional wear sensors and wear diagnostic equipment.

1.2 Air Disc Brake Identification
Locate the identification label near the guide pin housing. See below for information about the label fields used.

Figure 2 – Typical Part Number Label Location

Figure 3 – Part Number Label Information

Figure 1 – Bendix® ADB22X™ Air Disc Brakes
GENERAL SAFETY GUIDELINES
WARNING! PLEASE READ AND FOLLOW THESE INSTRUCTIONS TO AVOID PERSONAL INJURY OR DEATH:

When working on or around a vehicle, the following guidelines should be observed AT ALL TIMES:

▲ Park the vehicle on a level surface, apply the parking brakes and always block the wheels. Always wear personal protection equipment.
▲ Stop the engine and remove the ignition key when working under or around the vehicle. When working in the engine compartment, the engine should be shut off and the ignition key should be removed. Where circumstances require that the engine be in operation, EXTREME CAUTION should be used to prevent personal injury resulting from contact with moving, rotating, leaking, heated or electrically-charged components.
▲ Do not attempt to install, remove, disassemble or assemble a component until you have read, and thoroughly understand, the recommended procedures. Use only the proper tools and observe all precautions pertaining to use of those tools.
▲ If the work is being performed on the vehicle’s air brake system, or any auxiliary pressurized air systems, make certain to drain the air pressure from all reservoirs before beginning ANY work on the vehicle. If the vehicle is equipped with a Bendix® AD-IS® air dryer system, a Bendix® DRM™ dryer reservoir module, or a Bendix® AD-9si® air dryer, be sure to drain the purge reservoir.
▲ Following the vehicle manufacturer’s recommended procedures, deactivate the electrical system in a manner that safely removes all electrical power from the vehicle.
▲ Never exceed manufacturer’s recommended pressures.
▲ Never connect or disconnect a hose or line containing pressure; it may whip and/or cause hazardous airborne dust and dirt particles. Wear eye protection. Slowly open connections with care, and verify that no pressure is present. Never remove a component or plug unless you are certain all system pressure has been depleted.
▲ Use only genuine Bendix® brand replacement parts, components and kits. Replacement hardware, tubing, hose, fittings, wiring, etc. must be of equivalent size, type and strength as original equipment and be designed specifically for such applications and systems.
▲ Components with stripped threads or damaged parts should be replaced rather than repaired. Do not attempt repairs requiring machining or welding unless specifically stated and approved by the vehicle and component manufacturer.
▲ Prior to returning the vehicle to service, make certain all components and systems are restored to their proper operating condition.
▲ For vehicles with Automatic Traction Control (ATC), the ATC function must be disabled (ATC indicator lamp should be ON) prior to performing any vehicle maintenance where one or more wheels on a drive axle are lifted off the ground and moving.
▲ The power MUST be temporarily disconnected from the radar sensor whenever any tests USING A DYNAMOMETER are conducted on a vehicle equipped with a Bendix® Wingman™ system.
▲ You should consult the vehicle manufacturer’s operating and service manuals, and any related literature, in conjunction with the Guidelines above.

WARNING: Not all wheels and valve stems are compatible with Bendix Air Disc Brakes. Use only wheels and valve stems approved by the vehicle manufacturer to avoid the risk of valve stem shear and other compatibility issues.

WARNING: AVOID CREATING DUST. POSSIBLE CANCER AND LUNG DISEASE HAZARD.

While Bendix Spicer Foundation Brake LLC does not offer asbestos brake linings, the long-term affects of some non-asbestos fibers have not been determined. Current OSHA Regulations cover exposure levels to some components of non-asbestos linings, but not all. The following precautions must be used when handling these materials.

▲ Avoid creating dust. Compressed air or dry brushing must never be used for cleaning brake assemblies or the work area.
▲ Bendix recommends that workers doing brake work must take steps to minimize exposure to airborne brake lining particles. Proper procedures to reduce exposure include working in a well-ventilated area, segregation of areas where brake work is done, use of local filtered ventilation systems or use of enclosed cells with filtered vacuums. Respirators approved by the Mine Safety and Health Administration (MSHA) or National Institute for Occupational Safety and Health (NIOSH) should be worn at all times during brake servicing.
▲ Workers must wash before eating, drinking or smoking; shower after working, and should not wear work clothes home. Work clothes should be vacuumed and laundered separately without shaking.
▲ OSHA Regulations regarding testing, disposal of waste and methods of reducing exposure for asbestos are set forth in 29 Code of Federal Regulations §1910.001. These Regulations provide valuable information which can be utilized to reduce exposure to airborne particles.
▲ Material Safety Data Sheets on this product, as required by OSHA, are available from Bendix. Call 1-800-247-2725 and speak to the Tech Team or e-mail techteam@bendix.com
**WARNING:** If pads or rotors show signs of premature wear or failure, verify the brake chamber is sized appropriately for the application. An over-sized brake chamber can result in excessive force being applied to the brake pads and rotors. Additionally, under-sized brake chambers can result in too little braking force being applied to the brake and could increase the time and distance needed to stop the vehicle. See the table below for brake chamber guideline.

1.3 Rotor Identification
See Figure 4 to help you identify which type of rotor is used on the axle being inspected. Note that the maintenance inspection procedure will depend on the type of rotor installed.

![Figure 4 – Rotor Identification](image)

**CAUTION:** Rotors may not be mixed on a single axle: axles are only permitted to have all conventional or all Bendix® Splined Disc® brake rotors.

1.4 Wear Sensor Identification
See Figure 5 for the electronic wear sensor that may be present.

![Figure 5 – Electronic Wear Indicator Components](image)

Consult the instruction sheet included with wear indicator kits for installation information.

1.5 Operation
Bendix air disc brakes convert air pressure into braking force. (See Figure 6.) When the vehicle brakes are applied, air enters the service brake chamber through the supply port, applying pressure within the diaphragm. The pressure expands the diaphragm—applying force to, and moving, the pressure plate and pushrod forward. The pushrod acts against a cup in the internal lever—which pivots on an eccentric bearing—moving the bridge. Moving against a return spring, the bridge transfers the motion to two threaded tubes and tappets, which move the inner brake pad. The inner brake pad (from its normal position of having a running clearance between it and the rotor) moves into contact with the brake rotor. Further movement of the bridge forces the caliper—sliding on two stationary guide pins—away from the rotor. That, in turn, pulls the outer brake pad into the rotor. The clamping action of the brake pads on the rotor applies braking force to the wheel.

![Figure 6 – Sectional View Showing Brake Operation](image)

1.5.1 Brake Release and Adjustment
When the vehicle brakes are released, the air pressure in the service brake chamber is exhausted and the return springs in the chamber and the bridge return the air disc brake to a neutral, non-braked position. To maintain the running clearance gap between the rotor and the brake pads over time, the non-braked position is mechanically adjusted by a mechanism in the caliper. The adjustment mechanism operates automatically whenever the brakes are activated, to compensate for rotor and brake pad wear and to keep the running clearance constant. During pad or rotor maintenance, the technician manually sets the system’s initial non-braked position. The total running clearance (the sum of clearances on both sides of the rotor) should be between 0.024 to 0.043 in. (0.6 to 1.1 mm).
Figure 7 – Sectional Views
For Bendix® Air Disc Brakes, as a vehicle travels forward, the wheel always rotates towards the fixed-pin side of the caliper first.

On most vehicles, Type A calipers are used on the passenger’s side of the vehicle. (There are some rare driver’s side applications.)

On most vehicles, Type B calipers are used on the driver’s side of the vehicle. (There are some rare passenger’s side applications.)

SECTION TWO: PREVENTIVE MAINTENANCE SCHEDULE AND WHEEL-ON INSPECTIONS

2.0 PREVENTIVE MAINTENANCE

Regular inspection and maintenance of air disc brake components is an important part of vehicle maintenance.

The maintenance practices outlined here are recommended in addition to all standard industry practices (including daily pre-trip inspections.) Also, see the vehicle’s manual for recommendations. Keep track of the results of your maintenance inspections to assist you in determining the ideal maintenance intervals for the vehicle.

Use the table below for a guide to maintenance interval planning, however, depending on the particular vehicle’s use, more frequent checks of the components may be necessary.

* For vehicles with electronic wear indicators, use the dash indicator(s) and/or the hand-held diagnostic tool to regularly monitor the pad wear.

See Section 5.2.

<table>

<tr>
<td>About every four (4) months for over-the-road applications:</td>
</tr>
<tr>
<td>e.g. line haul, RV, open-highway coaches, etc.</td>
</tr>
<tr>
<td>At the very least, every four (4) months</td>
</tr>
<tr>
<td>About every three (3) months for higher-duty applications:</td>
</tr>
<tr>
<td>e.g. pick-up &amp; delivery, off-highway, construction, logger, concrete mixer, dump truck, city transit bus, refuse, school buses, etc.</td>
</tr>
<tr>
<td>At least once every year (and at every pad replacement)</td>
</tr>
</tbody>
</table>

**Inspections with the wheel mounted (Sections 2.1 - 2.3)**

- Inspect the pad thickness by checking the mechanical wear indicators*. See Section 2.1.
  - ✔
  - ✔
  - ✔
  - ✔

- Inspect the running clearances using the quick inspection technique. See Section 2.2.
  - ✔
  - ✔
  - ✔
  - ✔

- Inspect the visible part of the rotors for cracks, etc. See Section 2.3.
  - ✔
  - ✔
  - ✔
  - ✔

**Inspections with wheel removed (Section 4)**

- Inspect the pads and entire rotor surfaces for cracks, etc. (Bendix® Splined Disc® rotors: Inspect retaining hardware and check torques) See Section 2.3.
  - ✔

- Inspect the running clearances and adjuster operation. See Sections 2.2 and 4.2.
  - ✔

- Inspect the caliper travel. See Section 4.1.
  - ✔

- Inspect the tappet and boot assemblies. See Section 4.6.
  - ✔

- Inspect all caps, hoses, and brake exterior for damage etc.
  - ✔

Table 1 – Preventive Maintenance Schedule
2.1 BRAKE PAD AND ROTOR INSPECTIONS

Visual checks of the condition of the brake pad/rotor wear can be made without removing the wheels. Where dust guards are not used, the top of the pads and part of the rotor are visible through the opening at the top of the brake. Other visible portions of the rotor can be inspected at the same time.

Unless a vehicle has been stored for some time, the main rotor surfaces that contact the pads will always appear to be shiny. Surface rust on these surfaces would indicate a malfunctioning brake that should be inspected immediately.

Pads are 1.181 in. (30 mm.) thick when new and must be replaced when they reach 0.433 in. (11 mm.). Rotors are 1.77 in. (45 mm.) thick when new and must be replaced when they reach 1.46 in. (37 mm.). See Section 4.3 for further inspection criteria.

2.1.1 Electronic Wear Indicators

Use the dash indicator(s) and/or a hand-held diagnostic tool to regularly monitor the pad wear. (See Section 5.2.)

2.1.2 Mechanical Wear Indicators

See Figure 9 for the location of the mechanical wear indicators. There are two types (See Figure 10 for Style A and Figure 11 for Style B).

Note: These mechanical wear indicators do not constitute “out-of-service” criteria. These inspections only show when to schedule a full wheel-removed inspection of the brake pads and rotor. The thicknesses of the pad and rotor will both affect the wear indicator position at which maintenance is actually needed.

Wear Indicator Style A:

Where both the carrier and caliper have an indicator notch.

Compare the relative position of two notches cast into the carrier and caliper. When the two notches align, it is time to schedule a full, wheel-removed inspection of the pads and rotor.

Figure 10 – Style A - Both Carrier and Caliper have a Cast Notch

Wear Indicator Style B:

Where only the caliper has an indicator notch.

When the notch in the caliper aligns with the front edge of the torque plate, it is time to schedule a full wheel-removed inspection of the pads and rotor.

Figure 11 – Carrier Wear Indicator Notch and Backing Plate Alignment
2.1.3 Rotor Quick Inspection

See Figure 12. See the various potential rotor conditions that you may find. See the criteria below for whether the rotor needs to be replaced and/or scheduled for a full inspection.

2.2 RUNNING CLEARANCE QUICK INSPECTION

CAUTION: Follow all safe maintenance practices.

On level ground, with the wheels chocked and the parking brake temporarily released, check for movement of the brake caliper. This small movement, less than 0.08" (2 mm) – approximately the thickness of a nickel – in the inboard/outboard direction indicates that the brake is moving properly on its guide pins.

If the caliper has no movement or appears to move greater than the distances noted above, a full wheel-removed inspection will be necessary (See Section 4.1).

Figure 12 – Examples of Acceptable and Non-acceptable Rotor Cracks and Grooves

In addition, follow the recommendations of the vehicle manufacturer.

Note: Axles should have either all Bendix Splined Disc (or all conventional) rotors.
Air Disc Brake Inspection

Follow safe maintenance practices; chock wheels. Engage spring brakes and cage spring. Release spring brakes and drain air from system.

Raise axle, spin the wheel by hand.

Does the wheel turn smoothly?

Is the spring brake fully/partially applied?

Check running clearance (4.1) - OK?

Check adjuster (4.2) - OK?

Check caliper guidance (4.5) - OK?

Replace caliper/carrier assembly (5.3)

Drain air pressure from system. Restart test after caging spring brakes

Replace caliper/carrier assembly (5.3)

Check running clearance (4.1) - OK?

Check adjuster (4.2) - OK?

Check pad and rotor wear (4.3-4.4) - OK?

Replace components as needed with genuine Bendix® parts.

Disc brake OK

Replace guide pins (5.6) OR replace caliper/carrier assembly (5.3)

Tightness not due to air disc brake. See vehicle manual.

Check running clearance (4.1) - OK?

**Non-Serviceable:** These are non-serviceable items and pending warranty terms; these issues may be covered under warranty.

| K | Adjuster not rotating | Caliper only must be replaced with malfunctioning adjuster. | | |
| L | Adjuster too tight, dragging brake | | | |
SECTION FOUR: WHEEL-OFF MAINTENANCE INSPECTIONS

4.0 WHEEL-OFF INSPECTIONS

CAUTION: During these inspections, follow all safe maintenance practices, including those on page 2 of this service manual. Also, follow the vehicle manufacturer’s recommendations. When working on foundation brakes, be sure that the vehicle is on level ground, that the vehicle is parked by other means than the foundation brakes, and that the wheels are chocked.

4.0.1 Wheel Removal and Re-Installation

Refer to the vehicle manufacturer’s recommendations for removing the wheel.

Note: When removing the wheel, inspect first to see that there is no contact between the caliper and axle, vehicle, chassis sections or carrier, etc. that may be impeding the free movement of the caliper.

WARNING

Not all wheels and valve stems are compatible with Bendix® Air Disc Brakes. Use only wheels and valve stems approved by the vehicle manufacturer to avoid risk of valve stem shear and other compatibility issues. After re-installing a wheel according to the vehicle manufacturer’s recommendations, ensure that there is sufficient clearance between the tire inflation valve stem, the caliper, and the wheel rim, to avoid damage.

4.1 CALIPER MOVEMENT TEST

CAUTION: Follow all safe maintenance practices.

Remove the wheel. With the spring brakes released or caged, push the caliper assembly inboard on its guide pins. Note: To fully release the spring brakes, ensure that the air system pressure is at least 90 psi. Using a suitable tool (for example a large flat-blade screwdriver), press the inboard pad (12) away from the tappets. Check that there is no dirt, etc. in the gap, and clean if necessary. Then use two long-blade feeler gauges to measure – over the whole tappet surface – the gap between them and the inboard pad backplate. (See Figure 16.) The gap should be between 0.024 in. (0.6 mm) and 0.043 in. (1.1 mm). If the gap is within the range given, the test is complete.

Figure 15 – Pull Caliper Inboard

Figure 16 – Running Clearance Check

CAUTION: If the clearance is too wide, there is a danger of brake failure. If the clearance is too small, or if there is no gap at all, there is a danger of the brake overheating. These conditions must be corrected before returning the vehicle to service.

For further investigation, where there is some gap, go to Section 4.2 and check the adjuster mechanism. Where there is no movement at all (and so no gap to measure), go to Section 4.5 “Guide Pin Inspection.”
4.2 ADJUSTER MECHANISM INSPECTION

CAUTION: Follow all safe maintenance practices. Aside from the normal maintenance schedule, the adjuster mechanism inspection that follows is also carried out when the Caliper Movement Test (4.1) finds that the running clearance is too small or too large.

4.2.1 With the spring brake released (or caged), remove the adjuster cap (37) using the tab, taking care not to move the shear adapter (61). Note: One of two styles of adjuster cap (stamped metal or plastic adjuster cap) may be used.

For illustration purposes, the exploded view (Figure 18) shows the adjuster (23) and shear adapter (61) separated. When using the adjuster mechanism, always have the shear adapter installed on the adjuster.

4.2.2 Using a 10 mm. six-point box wrench, turn the Shear Adapter (61) counterclockwise and listen for the sound of 3 clicks as the mechanism backs-off (increases) the running clearance. Note: Do not use an open-ended wrench as this may damage the adapter. See Figure 20.

CAUTION:
Never turn the adjuster (23) without the shear adapter (61) installed. The shear adapter is a safety feature and is designed to prevent excessive torque from being applied to the adjuster. The shear adapter will fail (by breaking) if too much torque is applied.
4.2.3 Where the adjuster mechanism is able to be backed-off normally, position a box-end wrench on the shear adapter so that it can turn clockwise freely without coming into contact with parts of the vehicle (See Figure 21). Make five to ten moderate applications of the brakes [at about 30 psi (2 Bar)], and observe that the box-end wrench or socket should turn clockwise in small increments.

NOTE: As the number of applications increases, the turning movement will decrease (as the brake reaches its normal calibration point).

If the box-end wrench does not: (a) turn at all; (b) turns only with the first application; or (c) turns forward and backward with every application, the automatic adjuster has failed and the caliper/carryer assembly must be replaced.

After completing these wheel-off tests, Bendix recommends installing a new adjuster cap (lightly greased using white, lithium-based grease) when returning the brake to service. Ensure that the tab is in the position shown in Figure 19.

4.3-4.4 BRAKE PADS AND ROTORS

CAUTION: Follow all safe maintenance practices.

If electronic wear sensors are present, see Section 5.2.

If dust covers are present, see Section 5.1.

See Figure 23. While pressing down against the pad retaining bar (11), remove and retain the clip (26), washer (45) and pin (44). Remove the pad retainer bar (11). Bendix recommends that these items be replaced with new (See available kits and parts, Section 5.0).

Follow the steps in Section 4.2 for backing-off the adjuster mechanism. Slide the caliper inboard then outboard to permit easy removal of the brake pads.

| A | New pad thickness (1.181 in.) (30 mm.) |
|   | BX276: Refer to diagram below for measurement locations BX275/BX283+: Measure anywhere on the backing plate surface. |
| B | New rotor thickness (1.77 in.) (45 mm.) |
|   | Minimum rotor thickness (1.46 in.) (37 mm) |
| C | Minimum friction material thickness (0.080 in.) (2 mm.) - approximately the thickness of a nickel |

Measurement locations for BX276 brake pads.
Do not measure on raised surfaces.

Figure 22 – Pad and Rotor Dimensions
See Figure 22 for initial brake pad and rotor dimensions, as well as minimum acceptable dimensions.

![Figure 23 – Retainer Bar Removal](image)

**4.3 INSPECT THE BRAKE PADS**

Regular inspection of the brake pads (even for vehicles that use an electronic wear indicator) is an important part of vehicle maintenance.

4.3.1 See Figure 22. If the thickness of the friction material—dimension “C”—is less than 0.080 in. (2 mm.), the pads must be replaced.

Bendix® ADB22X™, ADB22X-V™ and ADB22X™-LT air disc brakes use 0.35 in. (9 mm.) backing plates, so dimension “D” (the combined pad and backing plate thickness) must be a minimum of 0.43 in. (11 mm.).

4.3.2 Check for uneven end-to-end pad wear. If the difference in wear is greater than 0.080 in. (2 mm.), replace the brake pads and also inspect the guide pins. (See Section 4.5.)

4.3.3 Compare the thickness of the inboard and outboard pads of each set. If the difference between the inboard and outboard pad thickness is greater than 0.138 in. (3.5 mm.), replace the brake pads and inspect the guide pins (See Section 4.5).

If the results of the pad inspections are within the acceptable range, inspect the pad surface. (See Figure 24.)

![Figure 24 – Brake Pad Surface Inspection](image)

**CAUTION:** When replacing brake pads and rotors, use only Bendix® brand replacement pads and rotors and/or those approved by the OEM. Non-approved replacement disc pads or rotors can cause excess wear to brake components, and can increase the risk of rotors cracking, etc.
4.4 INSPECT THE ROTOR

CAUTION: Follow all safe maintenance practices.

Identify if the rotor is a Bendix® Splined Disc®, or Bendix® brand conventional rotor (See Section 1.03). Rotors should be inspected regularly (See Section 2.0 for recommended inspection schedule) and at each pad change.

4.4.1 Measure the thickness of the brake rotor at the thinnest point (Dimension “E” in Figure 22). Avoid measuring near the edge of the rotor as minor burrs may result in an inaccurate measurement. For Bendix brand rotors, replace the rotor when the minimum thickness of 1.46 in. (37 mm.) is reached. For other brands of rotors, refer to the rotor manufacturer’s guidelines.

4.4.2 Inspect the rotor surface. See Figure 25. The type of rotor, and also the size, depth and direction of the imperfections, must all be considered.

NOTE: If surface wear conditions F through J are in the permitted range, the rotor is still usable until it reaches the minimum acceptable thickness for the rotor manufacturer’s guidelines.

4.4.3 Machining (Grinding or Turning) Rotors

Bendix brand rotors are normally service-free. In the case of severe grooving of the entire friction surface, however, CONVENTIONAL ROTORS may be turned when changing pads, to increase the load-bearing surface.

---

**Figure 25 – Examples of Acceptable and Non-acceptable Rotor Conditions**

- **Area F**: No action is needed for small cracks spread over the surface (e.g. Area F).
- **Area G**: Cracks reaching either edge of the rotor are not acceptable for either type of rotor.
- **Area H**: For standard Bendix brand rotors, cracks running in a radial direction—like spokes of a wheel (see Area H)—less than 0.06 in. (1.5 mm) deep or wide are acceptable if they do not reach either edge (see Area G). Cracks are only acceptable if the length of the crack is less than 75% of dimension “f” (the width of the rotor contact area).
- **Area J**: For Bendix® Splined Disc® rotors, radial cracks are only acceptable if they are less than 0.04 in. (1.0 mm) deep or wide and if they do not reach either edge (see Area G). Crack lengths must be less than 75% of dimension “f” (the width of the rotor contact area).

In addition, follow the recommendations of the vehicle and rotor manufacturer.

*Note: Axles should have either all Bendix Splined Disc (or all conventional) rotors.*
MACHINING OF BENDIX® SPLINED DISC® ROTORS IS NOT PERMITTED.

CAUTION: Always maintain air disc brake pads and rotors within specifications. Excessive pad or rotor wear will degrade braking performance.

Periodic inspection of the Bendix Splined Disc attachment hardware is recommended to ensure optimum braking performance. Bendix recommends verifying the torque on the spring element fasteners whenever a brake inspection is performed.

**WARNING**

AFTER MACHINING/TURNING, THE MINIMUM ROTOR THICKNESS FOR BENDIX® BRAND ROTORS MUST BE AT LEAST 1.535 - 1.575 IN. (39 - 40 MM.). FOR OTHER BRANDS, CONSULT THE MANUFACTURER’S GUIDELINES. ALSO, CHECK THE VEHICLE MANUFACTURER’S RECOMMENDATIONS. FAILURE TO COMPLY MAY RESULT IN BRAKE FAILURE AND IN SERIOUS INJURY OR DEATH. MACHINING OF BENDIX SPLINED DISC ROTORS IS NOT PERMITTED.

4.4.4 Rotor Replacement

An axle is permitted to have only all Bendix Splined Disc, or all conventional, rotors.

When replacing rotors, be sure to adhere to the vehicle manufacturer’s recommendations, including bolt tightening torques. It is recommended to install only Bendix® brand rotors, and also that the pads should be replaced (as an axle set) at the same time.

**Non-Bendix® brand rotors.** If a non-Bendix brand rotor is used, confirm that it complies to the vehicle manufacturer’s recommendations.

CAUTION: The use of non-approved brake rotors may reduce levels of safety and invalidate the warranty.

See Section 5.7 for reinstallation procedures.

**4.5 GUIDE PIN BEARING INSPECTION**

CAUTION: Follow all safe maintenance practices.

This guide pin inspection should be carried out if the technician cannot move the caliper during a Caliper Movement Test (See Sections 2.2 and/or 4.1).

Measure the range of travel along the guide pin bearings:

4.5.1 Remove the Pads (See Section 4.3). Using hand pressure only (no tools), the caliper (1) should slide freely along the whole length of the guide pins. This movement should be at least 0.95 inch (25 mm) when the pads are not present. If the movement is less than this amount, replace the caliper/carrier assembly.
Measure the “play” (range of movement) in the guide pin bearings:

4.5.2 See Figures 26 and 27. With the wheel removed, remove the pad retainer bar (11). Temporarily replace the pads with two new pads (12). Attach a magnetic dial-gauge holder to the carrier (2) on the short bearing side of the caliper (1). Use the measuring point on the caliper (1) – see the callout in Figure 27. Press the caliper in the direction of the carrier (2) and set the dial-gauge to zero.

4.5.3 Place a suitable tool (e.g. a large flat-blade screwdriver) between carrier (2) and caliper (1) and use light hand force to move the caliper away from the carrier, until the movement stops. Read the maximum value on the dial-gauge. See Figure 27.

If the value is greater than 0.039 in. (1.0 mm), replace the guide pin bushings (See Section 5.6) OR replace the caliper/ carrier assembly (See Section 5.3).

Inspect the guide pin inner boots:

4.5.4 See Figures 28 and 29. With the pads removed, slide the carrier by hand to the inboard position (See Figure 28). By looking through the opening where the pads are installed—and also from below—inspect the inner boot (9) for each of the guide pins. INSPECT FOR DAMAGE, CUTS AND CRACKS. Replace damaged boots immediately to prevent dirt and/or moisture affecting the movement of the guide pins (See Section 5.4). Damaged or corroded guide pins will impair the operation of the brake.

In addition, during installation, the boots are compressed to minimize the amount of air trapped within them. Observe as you move the carrier back towards the outboard position; the boots should only expand outwards a small amount due to trapped air. The boots should normally (due to their ribbed construction) contract back into place as the caliper moves on the guide pins. The boots are not air-tight and so some trapped air is normal; excess air trapped will dissipate.

4.5.5 Inspect the original pads (See Section 4.3) and they may be reused if they are in good condition with sufficient pad thickness.

4.6 TAPPET AND BOOT ASSEMBLY INSPECTION

4.6.1 In order to inspect the tappet and boot assembly, remove the pads (12) (See Sections 4.3 or 5.2) and advance the shear adapter (61) clockwise.

CAUTION: NEVER EXTEND THE TAPPET MORE THAN 1.75 in. (44.5 mm). See Figure 29. Over-extending the tappet will result in the tappet losing engagement with the synchronizing mechanism. Since the mechanism can only be set at the manufacturing plant, the caliper/ carrier assembly must be replaced if this happens.

4.6.2 INSPECT THE TAPPET AND BOOT ASSEMBLIES (13) FOR EVIDENCE OF DAMAGE, CUTS, CRACKS, TEARS, AND EVIDENCE OF CORROSION, ETC. Damaged boots lead to the penetration of dirt and moisture, and can promote corrosion and impair the operation of the brake. Replace as necessary (See Section 5.5).

Figure 29 – Permitted Tappet Extension

Where the tappets and boots pass the inspection, retract the tappets using the shear adapter.

When installed, the boots are compressed to minimize the amount of air trapped within them. Observe as you move the tappet back using the shear adapter; the boots should only expand outwards a small amount due to trapped air. The boots should normally (due to their ribbed construction) contract back into place as the tappets move. Note: If the bellows have excess trapped air, then with the tappets retracted, remove and re-install the actuator to vent the excess trapped air (See Section 5.4).

Follow the reinstallation steps for the brake pads (See Section 5.2).

Table 2 – Maintenance Kits
5.0.1 GENERAL INFORMATION ABOUT BENDIX® AIR DISC BRAKE MAINTENANCE

When working on Bendix® Air Disc brakes, please note the following:

- Read and follow the Safe Maintenance Practices on page two.
- Depending on the particular axle, the technician may need to remove the caliper/carrier to allow sufficient access to perform the work.
- CAUTION: When using a hoist to support the air disc brake, do not attempt to use the pad retainer bar as a bracing point as it is not designed to support the weight of the brake. Instead, use a brace (or chain) wrapped around the entire brake to attach the hoist.

- When replacing bearings—or for any other maintenance procedure where the technician needs to remove the caliper/carrier assembly from the vehicle to perform the maintenance—replacement caliper/carrier bolts will be required. Please note that due to the high torque required, the original bolts cannot be reused. The bolts are available from the vehicle manufacturer.

- Not all wheels and valve stems are compatible with Bendix Air Disc Brakes. Use only wheels and valve stems approved by the vehicle manufacturer to avoid risk of valve stem shear and other compatibility issues.

5.0.2 SERVICE DVD

Order Bendix part number BW7356 for a DVD showing the full set of maintenance procedures included in this Service Data sheet.
5.1 **AIR DISC BRAKE SHIELD KIT**

5.1.1 **CAUTION:** Follow all safe maintenance practices, including those listed on page two of this document. Park the vehicle (by other means than the foundation brakes) on level ground and chock the wheels.

Note: Most torque plates manufactured after January 1, 2007 have the required torque plate tabs to permit these shields to be mounted.

This shield kit includes a brake pad shield, a rotor shield and the required attaching hardware for use in Bendix® ADB22X™, ADB22X-V™ and ADB22X™-LT Air Disc Brake applications where external contamination and excessive road debris is a concern. Brake pad and rotor shields can greatly reduce damage and/or premature wear of pads and rotors under these conditions.

During installation, verify that once the shield(s) are installed they will not come into contact with any vehicle components, suspension, housings, etc. through the full range of motion of the wheel. Keep in mind the particular use of the vehicle, the orientation of the brake on the axle and torque plate, the proximity of other axles, and/or the wheel/tire being used.

5.1.2 Remove and discard the spring clip and washer from the pad retainer pin. Remove and retain the retainer bar and retainer pin. Position the pad shield as shown and reinsert the retainer bar. Install the retainer pin. Use the included spring clip and washer to secure the retainer pin. Check that the pad shield is held securely in place by the retainer bar. See Figure 31 or 32.

---

**Figure 31 – Drive or Steer Axle Exploded View with Inset Showing Rotor Shield Installation**

**Figure 32 – Trailer Axle Exploded View with Inset Showing Rotor Shield Installation**

5.1.3 **Drive or Steer Axle Rotor Shields** (See Figure 31). Position the rotor shield between the torque plate and the rotor. The supplied cap screws pass through the mounting tabs in the torque plate and install into the shield. Torque cap screws to 44 ft-lbs (528 in-lbs).

5.1.4 **Trailer Axle Rotor Shields** (See Figure 32). Position the rotor shield with the torque plate between the shield and the rotor. With one (supplied) lock washer in place on each cap screw, pass the screws through the shield before mounting onto the threaded torque plate holes. Torque the cap screws to 24 ft-lbs (288 in-lbs).

Note: The installation of air disc brake shields does not eliminate the need for periodic maintenance and inspection of the air disc brake and entire wheel end for damage and/or wear. In addition, the truck and trailer manufacturer’s specific criteria for the brake shield requirements on air disc brakes should be consulted before either installing or removing air disc brake shields from a wheel end(s).
5.2 PAD REPLACEMENT

5.2.1 CAUTION: Follow all safe maintenance practices, including those listed on page 2 of this document. Park the vehicle (by other means than the foundation brakes) on level ground and chock the wheels.

The Bendix DVD (BW7356) shows this procedure.

Important: If the vehicle is equipped with spring brakes, cage the spring brakes on all axles to be worked on. Consult the vehicle manufacturer’s instructions as necessary. For Bendix® piston-style, see Section 5.4.

5.2.3 If the air disc brake is equipped with an electronic wear sensor indicator (see top of Figure 33), remove and retain the mounting hardware for the cable protection plate. The cable protection plate can then be set aside while servicing the pads. Note the position of the sensors in the brake pad channels, and carefully remove them. In most cases you do not need to release the cable connector in order to move the sensors away from the pad installation work area. Inspect the wear sensors – replace if damaged or abraded.

5.2.4 See Figure 34. Remove and discard the pin retention clip (26) and washer (5).

![Figure 34 – Pad Retainer Bar Removal](image)

5.2.5 While pressing against the pad retainer bar, remove the pin (11). Discard the pad retainer bar.

5.2.6 With the spring brake released (or caged), remove the adjuster cap (37) using the tab, taking care not to move the shear adapter (61). Note: Two sizes of adjuster caps are supplied in kits; use the same size as before in step 5.2.20.

5.2.7 Inspect the shear adapter (61). If significant corrosion and/or damage is present, remove the adjuster adapter using needle-nose pliers and replace with the adapter supplied in the kit and clean as necessary.

![Figure 35 – Exploded View of Adjuster and Adapter](image)

![Figure 36 – Cap Installed: Tab Location](image)

For illustration purposes, the exploded view (Figure 35) shows the adjuster (23) and shear adapter (61) separated. When using the adjuster mechanism, always have the shear adapter installed on the adjuster.
CAUTION: Never turn the adjuster (23) without the shear adapter (61) installed. The shear adapter is a safety feature and is designed to prevent too much torque being applied. The shear adapter will fail (by breaking) if too much torque is used.

Note: For wheel-ends with spring brakes, if a shear adapter fails, always double-check to verify that the spring brake has been released (or caged). If the spring brake is applied, release or cage the brake (ensure that the air system pressure is at least 90 psi) and start the procedure again.

If the shear adapter fails, you may attempt a second time with a new (unused) shear adapter. In cases where a second failure of the shear adapter confirms that the adjustment mechanism is seized, the caliper must be replaced.

5.2.8 Use a 10 mm., six-point box wrench (See Figure 37) to turn the adjuster counterclockwise until sufficient space exists to remove the brake pads. A clicking noise occurs each time the adjuster turns.

CAUTION! Avoid overloading or damaging the adjuster shaft. Do not use an open-ended wrench since it may damage the adjuster shaft.

Use these two inspections:

A. Check for uneven end-to-end pad wear. If the difference in wear is greater than 0.080 in. (2 mm.), replace the brake pads and also inspect the guide pins (See Section 4.5).

B. Compare the thickness of the inboard and outboard pads of each set. If the difference between the inboard and outboard pad thickness is greater than 0.138 in. (3.5 mm.), replace the brake pads and inspect the guide pins (See Section 4.5).

5.2.12 Inspect the brake rotor (See Section 4.4).

5.2.13 Inspect the guide pins (See Section 4.5).

Important: To maintain optimal braking, Bendix strongly recommends that whenever brake pads are replaced, the complete axle set be replaced together. Use only pads which are permitted by the vehicle manufacturer, axle manufacturer, and/or disc brake manufacturer. Failure to comply with this may invalidate the vehicle manufacturer’s warranty.

Before installing the brake pads, use the adjuster to fully retract the tappets to provide adequate clearance.

5.2.14 Clean the surfaces that will come in contact with the brake pad.

Caution: When installing pads and retaining springs, where appropriate, use heavy duty gloves and always keep fingers away from potential pinch hazard areas.

5.2.15 Install the pad retaining springs(2) onto the brake pads(12) by inserting one end of the spring onto the lug at the top of the brake pad (See Figure 39). Carefully apply enough force to permit the second lug to fully engage, taking care to keep fingers etc. away from the spring as it seats.

5.2.16 Pull the caliper fully outward and install the outboard pad. Move the caliper fully inward and install the inboard pad.

5.2.17 To reinstall wear indicators (if used): Insert the wear sensors into position in the new brake pads. Route the sensor cable through the cable protection plate channel and secure the plate with the mounting hardware retained at disassembly. (See Section 5.2.)
5.3 CALIPER/CARRIER/ACTUATOR ASSEMBLY

CAUTION: Follow all safe maintenance practices, including those listed on page 2 of this document. Park the vehicle (by other means than the foundation brakes) on level ground and chock the wheels.

CAUTION: When using a hoist to support the air disc brake, do not attempt to use the pad retainer bar as a bracing point. It is not designed to support the weight of the brake. Use instead a brace (or chain) wrapped around the entire brake to attach the hoist.

5.3.1 In all cases check that the current hose routing arrangement does not restrict the full travel of the caliper before beginning work on the assembly.

5.3.2 Remove the brake pads (See Section 5.2).

5.3.3 (See Section 5.4). If the actuator used is a spring brake, following the manufacturer’s guidelines, cage the spring. With all air pressure drained from the system, disconnect the air hoses from the brake chamber.

Vertical Mounting Bolt Style

The brake pads and rotor must be maintained within the recommended wear limits. Failure to monitor wear and replace the brake pads and rotor when required may result in diminished brake performance.

5.3.4 See Figure 41. Supporting the air disc brake by necessary means, remove the six (6) mounting bolts/washers and discard. Note: Bendix strongly recommends that during reassembly these bolts are replaced – see your vehicle manufacturer for replacement hardware. Lift the caliper up off the anchor plate.

The vertical bolt assembly includes an alignment bushing. This bushing must be saved for reuse during reassembly of the brake. The bushing mounts in the torque plate and maintains the correct alignment of the brake assembly relative to the rotor.
5.3.5 If the brake assembly does not separate from the anchor plate it may be helpful to install an M16 x 2.0 screw longer than 120 mm at the bushing locations and tap the end of the bolt with a hammer to free the brake assembly. Remove the assembly.

**Axial Mounting Bolt Style**

5.3.6 Disconnect the air hose(s) to the brake chamber. See Figure 42. Supporting the air disc brake by necessary means, remove the six bolts attaching the brake to the anchor plate and remove the caliper/carrier assembly from the vehicle.

*Note: Bendix strongly recommends that during reassembly these bolts and washers are replaced. See your vehicle manufacturer for replacement hardware. Remove the assembly.*

**Reinstallation (Both Styles)**

5.3.7 Supporting the air disc brake by necessary means, attach the brake to the anchor plate using six (new) bolts. Torque to vehicle manufacturer’s specifications. If torque values and bolts are not specified by the vehicle manufacturer, then select a replacement bolt as shown in Table 4.

5.3.8 Reinstall the air hoses *(See Section 5.4.8-9) and check for leaks.*

5.3.9 Inspect and reinstall the pads *(See Section 5.2).*

*Figure 42 – Axial Mount Caliper/Carrier*
**Air Disc Brake Attachment Hardware**

### Vertical Mount

- **Service Actuators Shown**
- **Sheer Sleeve above, in this location**
- **Brake’s short (floating Pin) is this side**
- **Washers are not used on vertical-mounted ADB22X™ assemblies**

### Left-Hand Brake Torque Pattern (Viewed from Below)

- **Brake’s short (floating Pin) is this side**

### Right-Hand Brake Torque Pattern (Viewed from Below)

- **Brake’s short (floating pin) is this side**

### Axial Mount

- **Caliper/Carrier Assembly (showing service actuator)**
- **Six (6) Mounting Bolts and Washers are Required**
- **Anchor Plate/ Torque Plate**

### Fastener & Torque

- **Fastener:** M16 x 2.0 x 110 mm, Class 10.9. Use the manufacturer’s recommendations, but if unavailable, use a plain and oil-finish fastener. **Bendix strongly recommends using new fasteners each time.**

- **Washer:** None used.

- **Torque:** Using the torque pattern below, pre-torque to between 40-50 ft-lbf [54-68 N·m], with a final torque 180-200 ft-lbf [244-271 N·m]

#### Torque Pattern

- *Any cross-pattern, see the example below:*
  - 1
  - 5
  - 6
  - 4
  - 3
  - 2

### Trailer Torque Plate

- **Fastener:** M20 x 2.5 x L  Class 10.9
  - Length determination:
    - \( L = \text{Torque Plate (TP) thickness + Carrier engagement + Washer thickness} \)
    - \( L_{\text{min}} = \text{TP thickness + Carrier engagement + 3 mm} \)
    - \( L_{\text{max}} = \text{TP thickness + 29 mm + 3 mm} \)

- **Use the manufacturer’s recommendations.**
  - If unavailable, use phosphate and oil finish fastener:
    - Pre-Torque: 20-60 ft-lbf [27-81 N·m]
    - Final Torque: 350-400 ft-lbf [475-542 N·m]

- **Washer:** Requires THROUGH HARDENED 3 mm (minimum thickness) for each bolt.³

**Table 4 – Torque Plate Fasteners and Torque Recommendations (see manufacturer’s recommendations)**
5.4 SPRING OR SERVICE BRAKE

5.4.1 CAUTION: Follow all safe maintenance practices, including those listed on page 2 of this document. Park the vehicle (by other means than the foundation brakes) on level ground and chock the wheels.

5.4.2 Use the spring brake manufacturer's recommended safety practices in all cases.

Some spring brake and vehicle manufacturers permit caging the spring brake while the spring brake is engaged.

THE FOLLOWING INSTRUCTIONS ARE FOR BENDIX® BRAND PISTON-STYLE ACTUATORS.

5.4.3 With the vehicle on a level surface and the wheels properly chocked, apply air to release the spring brakes (parking brakes) by using the dash-mounted air control valve. Back out the release bolt (See Figure 43, arrow “D”), using a maximum torque of 26 ft-lbs (35 Nm) to cage the air released spring force on the pushrod.

Figure 43 – Actuator Spring Caging and Removal

5.4.4 Exhaust the air from the brake chambers by using the dash-mounted air control valve. With all air pressure drained from the system, disconnect the air hoses from the brake chamber. While supporting the brake chamber in position, remove and discard the brake chamber mounting nuts (See Figure 45, arrows marked “B”). Remove the brake chamber.

5.4.5 Reinstallation. Before installing the brake chamber, the actuator flange (See Figure 46, arrow “C”) must be cleaned and inspected. Consult the vehicle manual. The spherical cup in the lever (19) must be greased with white grease (Part No. ITI4525 or K021964). Add grease to the rubber gasket on the chamber.

CAUTION: Do not use grease containing molybdenum disulfate.

5.4.6 The seal, as well as the pushrod area, must be clean and dry.

Figure 44 – Spring Brake Installation

CAUTION: Do not use brake chambers with seals that have a thickness less than 0.12 in. (3 mm). Use only actuators which are recommended by the vehicle manufacturer.

5.4.7 Install the brake chamber using new self-locking nuts (EN ISO 10513). Alternately tighten both the nuts step-by-step up to a final torque of 133 ± 7 ft-lbs (180 ± 10 Nm). Bendix strongly recommends that new nuts be used.

5.4.8 Reconnect the air hose(s) and be sure that each hose is not twisted or in contact with moving vehicle components. The air hose routing must allow for full caliper travel. Note that for spring brake service chambers the ports are indicated by: “11” Service Brake Port and “12” Spring Brake Port

Figure 45 – Port Designations

Note: Where a new spring brake chamber is being installed, note that in some cases drain plugs are installed (See Figure 43, arrows marked “A”). Where drain plugs are present, after installation, remove whichever plug is at the lowest position. The selected drain hole must be aligned downwards (or within ±30°) when installed on the vehicle. In the case of spring brake chambers, install the pads before uncaging the spring.

5.4.9 Before returning vehicle to service, with the system pressurized, using a soap solution, check for air leakage. Minimal leakage in the area around the diaphragm is permitted (100 SCCM), and a one-inch bubble in one minute at the hose fitting is acceptable. If abnormal leakage is detected, the diaphragm must be replaced, or fitting adjusted, respectively.
5.5 TAPPET & BOOT ASSEMBLIES, AND TAPPET INNER SEAL REPLACEMENT

5.5.1 CAUTION: Follow all safe maintenance practices, including those listed on page 2 of this document. Park the vehicle (by other means than the foundation brakes) on level ground and chock the wheels.

In some cases, the technician will need to remove the caliper carrier assembly from the vehicle. (See Section 5.3.) Note that new bolts (available from the vehicle manufacturer) will be needed for reinstallation.

Important: If the vehicle is equipped with spring brakes, cage the spring brakes on all axles requiring work. Consult the vehicle manufacturer’s instructions as necessary. This procedure may be carried out with the air disc brake installed on, or removed from, the vehicle. In cases where the caliper/carer assembly is removed from the vehicle, NEW fasteners must be used and properly torqued during reinstallation. Use only fasteners approved by the vehicle manufacturer.

Note: This maintenance procedure uses specialized tools. The full Bendix® air disc brake tool kit (K029164), or Ken-Tool® kit (80000), includes the complete set of tools required for all permitted maintenance procedures. Alternately, for locations where only the tappet and boot replacement procedures will be performed, the smaller Bendix tool kit (K028829), or Ken-Tool kit (80001) will suffice. The Bendix DVD (BW7356) shows this procedure.

Table 5 – Tappet and Boot Replacement Tools

5.5.2 Pad Removal: follow Sections 5.2.1-5.2.11 for removal of the brake pads.

5.5.3 Inspect the Brake Rotor (See Section 4.4).

Tappet and Boot Assembly (13) Removal

CAUTION: NEVER EXTEND THE TAPPET MORE THAN 1.75 in. (44.5 mm). See Figure 47. Over-extending the tappet will result in the tappet losing engagement with the threads of the synchronizing mechanism. Since the mechanism can only be set at the manufacturing plant, the caliper/carer assembly must be replaced if this happens.

![Figure 46 – ADB Exploded and Section Views](image)

![Figure 47 – Permitted Tappet Extension](image)
5.5.4 See Figure 47. Extend the tappets – less than 1.75 in. (44.5 mm) – by turning the shear adapter (61) clockwise. A screwdriver (callout “B” in Figure 47 inset) should be used to move the boot and allow the wedge fork (“A” in Figure 48) to be inserted.

CAUTION: Do not insert the screw driver more than ¼ inch. Take care not to damage the inner sealing face (see arrow “X” in Figure 48). Gouges or grooves will prevent a good seal and will require that the caliper be replaced.

![Figure 48 – Wedge Tool Use](image)

5.5.5 The tappet and boot assemblies (13) can then be removed from the threaded tubes (16) by using the wedge fork (T15). Be sure to orient the wedge tool with the tapered side towards the tappet.

5.5.6 Remove the old tappet bushings (161).

5.5.7 Retract the threaded tubes by turning the shear adapter (61) counterclockwise.

5.5.8 See Figure 49. Carefully remove the inner seal using one or two flat-blade screwdrivers as shown. Caution: Do not insert the screwdrivers so far that they come into contact with the threaded tubes. Damage to the threaded tubes would require that the brake be replaced.

![Figure 49 – Inner Seal Removal](image)

5.5.9 Inspect the inner sealing face for damage. If damage is found that would cause the inner seals not to be able to seal properly, the caliper/carrier assembly must be replaced. Clean the area around the inner seal.

5.5.10 Inspect the threaded tubes (16). See Figures 50 and 51. Extend the tubes, but by less than 1.75 in. (44.5 mm), by turning the shear adapter (61) clockwise. Inspect the threads for rust, corrosion, or damage etc. If there is evidence of damage to the threads, significant rust, or corrosion, the caliper/carrier assembly must be replaced.

If the technician is working with the caliper on the vehicle, the technician may place a new brake pad (12) into the outboard gap to help avoid the loss of thread engagement of the threaded tubes. See Figure 50.

If the work is being carried out at a workbench, the technician may insert a 2.76 in. (70 mm) spacer (See callout “E” in Figure 51) into the caliper (1) to help avoid the loss of thread engagement.

![Figure 50 – Use of a New Brake Pad as a Spacer](image)

5.5.11 For threads that are in good condition, grease the threads with white grease (Part No. IT14525 or K021964). Before installing the replacement inner seals (22), retract the threaded tubes by turning the shear adapter (61) counterclockwise.

![Figure 51 – Use of a Spacer (off-vehicle inspection)](image)
Note: If the shear adapter fails while you are retracting the threaded tubes, you may try again with another (new) shear adapter. If this also fails, this indicates that the adjuster mechanism is damaged and the caliper must be replaced.

To install inner seals where the caliper is on the vehicle:

5.5.12 Position the replacement inner seal (22) over the threaded tube (16). See Figures 52 and 53 for the tools and installation arrangement used. Position the L1 (T3 + T9) with the short spacer (T3) in position as shown in Figure 53. Guide the tool over the end of the threaded tube (16). Install the new inner seal (22) into position by rotating the adjuster nut on the T3 portion of the tool, using an open-ended wrench.

Figure 52 – On-Vehicle Inner Seal Tool (L1)

Figure 53 – On-Vehicle Inner Seal Installation

To install inner seals where the caliper has been removed from the vehicle:

5.5.13 Position the replacement inner seal (22) over the threaded tube (16). See Figures 54 and 55 for the tools and installation arrangement used. The threaded tubes need to be retracted to allow the tool to be inserted. Use the combination tool L2 (T4 + T3 + T9) with the long spacer (T4) as shown in Figure 55. Since the installation tool is guided by the center post of the threaded tube, advance the tube a small amount to align the tool and the center post. Install the new inner seal (22) into position by rotating the adjuster nut on the T4 portion of the tool using an open-ended wrench.

Figure 54 – On-Vehicle Inner Seal Installation Tool (L2)

Figure 55 – Off-Vehicle Inner Seal Installation

CAUTION: To confirm that the inner seal has been correctly installed, begin to extend the threaded tubes (16) by turning the shear adapter clockwise by 4-5 turns. Watch as the threaded tube extends. Inner seals that are installed correctly WILL NOT ROTATE as the threaded tube extends.

5.5.14 Note: Inspect the tappet/boot kit to determine if the tappets supplied are already pre-greased (a plastic cover should be present — be sure to remove the cover when installing the tappet). Only in the case of kits that are not pre-greased will the installer need to apply grease to the tappets. In all cases, the threaded portion of the tubes will need to be greased. Retract the threaded tubes.

5.5.15 Install the new tappet bushing (161) onto the center post of each threaded tube (16) by hand. By hand, ease the tappet bushings onto the center post of the threaded tubes and they will snap into position.

5.5.16 The sealing seat in the caliper for tappet and boot assemblies (13) must be clean and free of grease. Wipe the opening with a clean shop rag. Place a tappet and boot assembly (13) in position over the center post and tappet bushing.

To install tappet and boot assemblies where the caliper is on the vehicle:

5.5.17 See Figures 56, 57, and 58. Use tool B1, comprising tools T1, T2, and T3 to press the boot into position. The tool is then reversed, and the nylon disc (T24)
is inserted into the T1 “cup” (combination tool ‘B2’). Holding the T1 handle, turn the nut on the T3 tool to fully install the tappet onto the tappet bushing (161).

Figure 56 – On-Vehicle Tappet and Boot Installation Tool (B1 - with T24 Installed, B2)

5.5.18 See Figures 59, 60, and 61. Retract the tappets, as needed, in order to have room to install the tappets. Use tool B3, comprising tools T1, T2, and T3 to press the boot into position. The tool is then reversed, and the nylon disc (T24) is inserted into the T1 “cup” (combination tool ‘B4’). Holding the T1 handle, turn the nut on the T3 tool to fully seat the tappet onto the tappet bushing (161).

Figure 57 – On-Vehicle Tappet Boot Installation

Figure 59 – Off-Vehicle Tappet Boot Installation Tool (B3, with T24 Installed, B4)

Figure 58 – On-Vehicle Tappet Installation

Figure 60 – Off-Vehicle Tappet Boot Installation

Figure 61 – Off-Vehicle Tappet Installation

5.5.19 Check that the tappets are firmly attached to the bushings by gripping and pulling lightly on them by hand. Confirm that the tappets are able to rotate a small amount on the tappet bushings by grasping and turning them by hand. Finally, using a box-end wrench on the shear adapter, extend the threaded tubes outward, and check that the boots are held in place. Retract the tappets.

5.5.20 Reinstall the caliper/carrier assembly, if it was removed from the vehicle (See Section 5.3).

5.5.21 Reinstall the brake pads (See Section 5.2).
**5.6 GUIDE PIN AND BOOT ASSEMBLIES**

The Bendix DVD (BW7356) shows this procedure.

**5.6.1 CAUTION:** Follow all safe maintenance practices, including those listed on page two of this document. Park the vehicle (by other means than the foundation brakes) on level ground and chock the wheels.

Important: If the vehicle is equipped with spring brakes, cage the spring brakes on all axles to be worked on. Consult the vehicle manufacturer's instructions as necessary. For Bendix® brand piston-style spring brake chambers, see Section 5.4.

These procedures are typically carried out with the caliper/carrier removed from the vehicle (may be carried out with the air disc brake installed). In cases where the caliper/carrier assembly is removed from the vehicle, NEW fasteners must be used and properly torqued during reinstallation. Use only fasteners approved by the vehicle manufacturer.

**Note:** This maintenance procedure uses specialized tools. The full Bendix® air disc brake tool kit (K029164), or Ken-Tool® kit (80000), includes the tools needed for the guide pin and boot installation. See Table 6.

Note that a smaller Bendix tool kit (K029107), or Ken-Tool kit (80002) may be used where only the guide pins will be serviced.
### Table 6 – Bendix® ADB22X™, ADB22X-V™ and ADB22X™-LT Air Disc Brake Guide Pin and Seals Replacement Tools (a washer is also included)

5.6.2 Remove the wheel. Refer to the vehicle manufacturer’s recommendations.

5.6.3 Remove the brake pads. See Section 5.2.

5.6.4 In most cases, the actuator should be removed. See Section 5.4. In the case of spring brake actuators, they should be caged before removing the brake assembly.

5.6.5 In nearly all cases, the air disc brake caliper/carer will need to be removed from the vehicle in order to complete this procedure. See Section 5.3.

5.6.6 Place the brake on a workbench and, using a vice, secure it by the carrier.

5.6.7 Use a small chisel or similar tool to punch a hole close to the center of the guide pin cap (10) of the short guide pin, taking care to only insert the chisel a small amount. Using the hole just made, pry the cap off and discard. See Figures 63-65.

5.6.8 Remove the other cap (68) that covers the long guide pin, by using a small chisel and hammer to apply light blows to the cap, with the chisel aimed away from the casting. See Figure 66. Discard both caps.
5.6.9 Using a 14 mm hex bit socket, remove and discard the two caliper bolts (39) and (40). See Figure 67. By hand, retract both guide pins slightly, and then remove the caliper from the carrier.

The guide pins are now only held by the retaining rings (58).

5.6.10 Remove the boot retaining rings (58) and the guide pins (39) and (40). Use a screwdriver to pry out the inner boots (9). See Figure 68. Discard the removed items.

5.6.11 Clean the caliper upper and lower surfaces around the bushings.

5.6.12 Prepare to remove the brass bushing used in the long guide pin side. Assemble the long bolt (T13), washer, and sleeve (T12) as in Figures 69 and 70.

5.6.13 Apply grease to the bolt and—after inserting through the guide pin channel—engage the brass nut (T14). Always double-check that the brass nut is correctly in place in the bushing before beginning to extract the bushing.

5.6.14 Turning the bolt at the top, draw the brass nut up, bring the brass bushing up and out of the channel. Discard the bushing.

Caution: Keep the removal tool exactly aligned with the guide pin channel to permit the bushing to be removed. See Figure 72.

5.6.15 Prepare to remove the short guide pin bushing by locating the bushing (6) tab, and using a small chisel (narrower than the tab) or similar tool, remove the tab as shown in Figure 73, by striking low on the base of the tab.

Remove the tab with a magnet and use a clean shop cloth to remove any excess debris. Note that in some cases, the tab may be in the opposite (outer) slot in the bore.

Grease the bolt prior to each use
5.6.16 Use the tool combination shown in Figures 74 and 75 (comprising T14, T20, T21, and a washer) to remove the bushing (6). Screw nut (T14) onto the assembly by hand, then tighten the bolt (T20) using a box end wrench to draw out the bushing. Discard the removed bushing, and verify that the bore is clean by wiping with a shop cloth.

**Figure 75 – Sectional View: Short Guide Pin Bushing Removal**

**Installation of the Fixed Guide Pin Brass Bushing**

5.6.17 Clean the caliper upper and lower surfaces around the bushings.

5.6.18 Clamp the carrier in a vise so that the guide channel is vertically oriented.

**Figure 76 – Long Guide Pin Bushing Installation and Dimpling Tool**

5.6.19 Place the washer and thread the brass nut (T14) on to the bolt (T13) followed by the flange (T08). See Figure 76.

5.6.20 Place a new brass guide bushing (7) on the dimpling tool (T16) and insert it into the caliper bore.

5.6.21 Check that the flange (T08) is in an upright position at the top of the caliper recess as you draw the brass bushing (7) up, by turning the brass nut (T14), until the dimpling tool bottoms on the caliper. When it reaches the correct position, the brass bushing extends out of the guide pin channel 0.039 in. (1 mm.).

5.6.22 With the dimpling tool (T16) in position, tighten the screw in its base until it contacts the dimpling screw housing. The movement of this screw forces three points outwards, leaving indentations in the brass bushing. See Figure 77, view “C”.

5.6.23 Unscrew the dimpling screw out approximately 0.75 inches (20 mm.). Loosen the brass nut (T14) and rotate the dimpling tool (T16) 60 degrees. Repeat the dimpling process by tightening the brass nut (T14) and then tight the dimpling screw until it contacts the dimpling screw housing. Back out the dimpling screw approximately 0.75 inches (20 mm.). The brass bushing (7) is now held in position by the six dimples made by the tool.

5.6.24 Remove the installation tools and check the brass bushing (7), removing any burrs, being careful not to leave any metal filings in the bushing. Coat the inside of the bushing with the white grease included in the kit.

**Installation of the Floating Guide Pin Bushing**

5.6.25 To install the bushing (6) into the short guide pin side, first inspect the bore for corrosion, damage etc. Clean as necessary.
5.6.26 Place the new bushing (6) in position so that when drawn into position, the tab will align with the slot in the casting. With the tab aligned, place tool (T14) over the bushing and tap lightly. To position the bushing, see Figure 78.

5.6.27 Use the tool combination shown in Figure 79 to draw the bushing (6) into the caliper. See also Figure 80, to see the orientation (with tool T14 at the top). Hand tighten the nut (T14) into position. Then tighten the bolt (T20) using a box end wrench or socket to draw the bushing (6) into the caliper until the bushing (6) contacts the machined step in the bore. Remove the tool.

5.6.28 Using a punch, bend the tab into the groove by aligning the punch with the upper part of the tab and tapping the punch with a hammer.

5.6.29 Coat the inside of the bushing (6) with a light coat of the white grease included in the kit.

5.6.30 Install the two identical inner boots (9) by first cleaning the area where the inner boots will be installed and inspect for corrosion. If the sealing surface of the caliper is damaged, replace the caliper.

5.6.31 See Figure 82. Place a boot into the installation tool (T7), making sure that the inner bellows are arranged close to the side walls of the tool and will not be damaged during installation. Also check that the outer edge of the boot rests on the front edge of the tool.

5.6.32 Using 70 in-lbs (8 Nm) of torque maximum, tighten bolt (T10) to install the inner boot.

5.6.33 Repeat the installation procedure for the second inner boot.

5.6.34 Check that the boots are held securely in place and that no damage occurred during installation.

5.6.35 See Figure 83. To install the guide pins, first lubricate both guide pins with the white grease supplied. Insert the guide pins into their respective bores with the grooved end towards the bellows.

Fit the lip in the end of the inner boots (8) into the groove of the guide pins. Push on each ring (7) ensuring that the boot (9) is engaged onto the end of the guide pins (5 or 6).
5.6.36 With the caliper resting on a bench, slide the carrier into place with a slight rocking motion, taking care that as you do so, the inner boots and guide pins are seated in their proper place on the carrier.

5.6.37 Identify the two caliper bolts (39) and (40). With the shorter bolt placed in the floating pin bushing (4), and the longer bolt placed in the fixed pin bushing (5), begin to tighten the bolts. With the caliper carrier in a vice, continue installing the bolts to a torque of 133 ft-lbs (180 Nm). Finally, tighten each bolt an additional 90° (ninety degrees).

**Installation of the Guide Pin Caps**

5.6.38 See Figure 84. Place the caliper carrier assembly on a bench so that the inner boots are fully compressed, check that the bores are clean and dry (e.g. free from lubrication).

Note: It is important that the inner boots are fully compressed during this procedure to ensure that the least amount of air is retained within the guide pin channel. If too much air is trapped, the bellows can potentially be damaged during the operation of the brake. *It is also important that the technician double-check that the retaining rings remain in their correct position during this procedure.*

5.6.39 Clean the two caps, and check that the caliper surfaces where the caps will be installed are clean and have no signs of damage.

5.6.40 Select one cap to install. Using the correct press-in tool — the smaller cap (10) installs in the long guide pin side using tool (T26), and the larger cap (68) installs in the short guide pin side using tool (T27) — place the cap in position, using the machined channel in the caliper to assist in centering the tool.

Use a hammer to tap the cap into position. See Figure 85. Note that the tool needs to remain perpendicular to the channel to prevent damage during installation. Note that, after installation, the smaller cap (10) extends 0.08 in. (2 mm.), and the larger cap (68) extends 0.61 in. (15.5 mm.).

Repeat for the second cap.

5.6.41 Check that the guide pins move freely when the carrier is moved laterally, and that air is not trapped within the inner boots, and that the boots (9) and ring (58) are in the proper position before continuing with the installation.

5.6.42 Install the caliper carrier (See Section 5.3).

5.6.43 Install the brake chamber (See Section 5.4).

5.6.44 Install the brake pads (See Section 5.2).
Bendix® Splined Disc® Hub Rotors are designed to assist vehicle maintenance by typically allowing the rotor to be serviced without requiring the entire hub/rotor assembly be replaced.

Periodic inspection of the Splined Disc attachment hardware is recommended to ensure optimum braking performance. Bendix recommends verifying the torque on the spring element fasteners whenever a brake inspection is performed.

NOTE: Anytime that the entire hub/rotor assembly is removed, Bendix recommends that the wheel seal also be replaced at the same time, USING A HIGH-TEMPERATURE SEAL. Follow the wheel seal and/or vehicle manufacturer’s guidelines for full installation instructions. Adjust the bearings and refill bearing oil to vehicle manufacturer’s specifications.

When replacing a splined disc rotor, Bendix strongly recommends that the brake pads be replaced (as an axle set.) Contact 1-800-AIR-BRAKE for the appropriate brake pad kit. Rotor replacement necessitates the removal of the pads.

CAUTION: Follow all safe maintenance practices, including those listed on page 2 of this document. Park the vehicle (by other means than the foundation brakes) on level ground and chock the wheels. Also read the vehicle manufacturer’s recommendations. When installing pads, where appropriate, use heavy duty gloves and always keep fingers away from potential pinch hazard areas.

Bendix® Air Disc Brakes are precision-engineered braking mechanisms. The “friction couple” braking characteristics have been carefully optimized and the rotor design and materials have been matched with special formulation brake pads for optimal performance, therefore use only genuine Bendix® brand parts and brake pads.

**Figure 86 – Splined Disc Rotor Examples - Exploded Views**

**Rotor Replacement**

5.7.1 Before removing the brake pads it is strongly recommended that the air disc brake adjuster mechanism be checked for correct operation (See Section 4.1). When replacing brake pads, Bendix strongly recommends that the pads be replaced as an axle set.

5.7.2 Refer to the vehicle manufacturer’s recommendations and release (or cage) spring brakes and remove the wheel.

5.7.3 Remove the pads (See Section 5.2).

5.7.4 Remove the air disc brake (See Section 5.3).

5.7.5 Remove the hub rotor assembly.

**Note:** Follow the vehicle manufacturer’s guidelines for removal of the wheel hub and rotor assembly from the vehicle in lieu of these instructions, where available.

**CAUTION:** Be sure to secure both the rotor and hub before removing the retention clips.

5.7.6 Remove and discard the ten spring elements.

5.7.7 On drive axles, the ABS tone ring must also be removed. (See Figure 86.) Retain for reinstallation.

5.7.8 Use suitable hand tools to remove the intermediate elements (spacers). Remove all the right-hand intermediate elements (spacers) of each set first and then the rotor can be turned slightly to release the remaining intermediate elements (spacers). In all cases, take care not to damage the hub and its teeth. Remove and discard the intermediate elements (spacers) and retention clips attaching the rotor. Discard the rotor.
5.7.9 Following industry standards, clean and inspect the hub before installing the rotor. Look for corrosion and/or damage to the hub and inspect the wheel speed tone ring. Where necessary, consult the hub manufacturer’s guidelines for more details.

Figure 87 – Rotor with Cross-Section View

KEY
1 - Wheel Hub
2 - Splined Disc Rotor
3 - Intermediate Element (Spacer)
4 - Spring Element (Fastener), including retention clips

Figure 88 – Rotor Installation

ROTOR INSTALLATION

5.7.10 See Figures 87 through 91. Place the rotor into position on the hub. Install the new intermediate elements (spacers) as shown in Figure 89. With all the intermediate elements (spacers) correctly inserted into position, verify that the gap between the intermediate elements (spacers) and the wheel hub does not exceed 0.015 in (0.4 mm). If a gap is found that exceeds this maximum value, verify the installation of new intermediate elements (spacers). Replace the wheel hub if the excess gap cannot be corrected with proper installation of new rotor retaining hardware.

Figure 89 – Installing Intermediate Elements (spacers)

Figure 90 – Intermediate Elements (Spacers) Installed

5.7.11 Install the ten new spring elements included in the kit in an evenly-distributed cross-pattern sequence. Torque to 22.1 ft-lbs (30 Nm)

5.7.12 Where the tone ring was removed during step 5.7.7, reinstall the tone ring. Use a professional grade fastener compound, such as Loctite® Blue 242®, on the fasteners. Torque to 19-22 in-lbs (2.1-2.5 Nm)

5.7.13 Reinstall the hub rotor assembly using a new high-temperature wheel seal, following the vehicle manufacturer’s instructions.
5.7.14 Reinstall the air disc brake *(See Section 5.3).* Supporting the air disc brake by all necessary means, attach the brake to the anchor plate using six bolts and washers as required (Bendix recommends the original bolts not be re-used). Torque to vehicle manufacturer's specifications. If torque values and bolts are not specified by the vehicle manufacturer, then torque according to the chart shown in Table 4. Be sure to select bolts with the same thread pitch, length and grade as originally provided from vehicle manufacturer.

5.7.15 Reinstall the brake pads *(See Section 5.2).*

**Figure 91 – Fasteners Installed**

---

**CONTACTING BENDIX**

**foundationbrakes.com**
- Bendix on-line information is available 24/7/365. It’s your complete Bendix resource.

**Bendix Technical Assistance Team**
- For direct personal technical support, call the Bendix TechTeam at 1-800-AIR-BRAKE (1-800-247-2725, option 2).
- Representatives are available to assist you Monday through Friday, 8:00 am to 6:00 pm ET, or email the Bendix Tech Team at: techteam@bendix.com.

**To better serve you, please collect the following information before you call the Bendix TechTeam, or include this information in your email:**
- Bendix product model number, part number and configuration.
- Vehicle make and model.
- Vehicle configuration. (Number of axles, tire size, etc.)
- System performance symptoms: When do they occur?
- What troubleshooting/measurements have been performed?
- What Bendix service data literature do you have or need?
Trucking moves fast. Move faster.
